ST7529

32 Gray Scale Dot Matrix LCD Controller/Driver

1. INTRODUCTION

The ST7529 is a driver & controller LSI for 32 gray scale graphic dot-matrix liquid crystal display systems. It generates 256 Segment and 160 Common driver circuits. This chip is connected directly to a microprocessor, accepts Serial Peripheral Interface (SPI), 8-bit/16-bit parallel or IIC display data and stores in an on-chip display data RAM. It performs display data RAM read/write operation with no external operating clock to minimize power consumption. In addition, because it contains power supply circuits necessary to drive liquid crystal, it is possible to make a display system with the fewest components.

Preliminary

2. FEATURES

Driver Output Circuits

–256 segment outputs / 160 common outputs

–Maximum resolution is 255 x 160

Applicable Duty Ratios

– Various partial display

– Partial window moving & data scrolling

Microprocessor Interface

– 8/16-bit parallel bi-directional interface with 6800-series or 8080-series

–4-line serial interface (write only)

–9 bit 3-line serial interface (write only)

–IIC serial Interface (write only)

On-chip Display Data RAM

– Capacity : 160 x 256 x 5bit = 204800bits (Max)

On-chip Low Power Analog Circuit

– On-chip oscillator circuit

– Voltage converter (x2, x3, x4, x5, x6, x7, x8)

– Voltage regulator

– Voltage follower

(LCD bias: 1/5, 1/7, 1/9, 1/10, 1/11, 1/12, 1/13, 1/14)

Operating Voltage Range

– Supply voltage

(VDD, VDD1, VDD2, VDD3, VDD4, VDD5): 2.4 to 3.6V

– LCD driving voltage (VLCD = V0 - VSS): 4.5 to 18.0V

Temperature measurement circuit

– On-chip temperature measurement without external component

LCD driving voltage (EEPROM)

– To store contrast adjustment value for better display

Package Type

– Application for COG

ST7529	**6800, 8080, 4-Line, 3-Line interface (without IIC interface)**	ST
ST7529i	**IIC interface**	I²C BUS

3. Pad Arrangement

Chip Size :

16.550mm x 1.525mm

Pad pitch :

Com, Seg pad pitch: 43μm

IO pad pitch: 110μm

Test pin pad pitch: 75μm

Pad size :

Com, Seg pad size:

Pad No1~362 : 25μm (X) x 96μm (Y)

Pad No363~390 : 96μm (X) x 25μm (Y)

Pad No544~571 : 96μm (X) x 25μm (Y)

IO pad pad size: 90μm (X) x 40μm (Y)

Test pin pad size: 55μm (X) x 40μm (Y)

Bump Height: 18± 3μm (Typ)

Chip Thickness: 625μm

7. FUNCTIONAL DESCRIPTION

7.1 MICROPROCESSOR INTERFACE

Chip Select Input

The XCS pin is for chip selection. The ST7529 can function with an MPU when XCS is "L". In case of serial interface, the internal shift register and the counter are reset.

7.1.1 Selecting Parallel / Serial Interface

ST7529 has seven types of interface with an MPU, which are four parallel and three serial interfaces. This parallel or serial interface is determined by IF pin as shown in table 7.1.1.

Table 7.1.1 Parallel / Serial Interface Mode

IF1	IF2	IF3	Interface type	XCS	A0	/RD(E)	/WR(R/W)	D15 to D8	D7 to D0	SI	SCL	ACK
H	H	H	80 serial 16-bit parallel	XCS	A0	/RD	/WR	D15 to D8	D7 to D0	--	--	--
H	H	L	80 serial 8-bit parallel	XCS	A0	/RD	/WR	--	D7 to D0	--	--	--
H	L	L	68 serial 16-bit parallel	XCS	A0	E	R/W	D15 to D8	D7 to D0	--	--	--
L	H	H	68 serial 8-bit parallel	XCS	A0	E	R/W	--	D7 to D0	--	--	--
L	L	H	9-bit SPI mode (3 line)	XCS	--	--	--	--		SI	SCL	--
L	L	L	8-bit SPI mode (4 line)	XCS	A0	--	--	--		SI	SCL	--
L	H	L	IIC	--	--	--	--	D7,D6 and D0~D3		D6	D7	D3,D2

Note: "--" means "disabled" in pins A0, E_RD, and RW_WR, and "high impedance" in pins DB0 to DB15.

7.1.2 8- or 16-bit Parallel Interface

The ST7529 identifies the type of the data bus signals according to the combination of A0, /RD (E) and /WR (W/R) as shown in table 7.1.2.

Table 7.1.2 Parallel Data Transfer

Common	6800-series		8080-series		Description
A0	R/W	E	/RD	/WR	
H	H	H	L	H	Display data read out
H	L	H	H	L	Display data write
L	H	H	L	H	Register status read
L	L	H	H	L	Writes to internal register (instruction)

Relation between Data Bus and Gradation Data

ST7529 offers the 2bytes 3pixels(2B3P), 3bytes 3pixels dither 1(3B3PD1) mode and 3bytes 3pixels dither 2(3B3PD2) mode to display 32 gray scale data.

(1) 2B3P 32 Gray Scale Display

1. 8-bit mode

D7	D6	D5	D4	D3	D2	D1	D0	
P0	P0	P0	P0	P0	P1	P1	P1	1st write
P1	P1	D	P2	P2	P2	P2	P2	2nd write

A single pixel of data is read after the second write operation as shown, and it is written in the display RAM.

"X" are dummy bits, which are ignored for display, "D" are dither bits, which are used for dither.

2. 16-bit mode

D15	D14	D13	D12	D11	D10	D9	D8	D7	D6	D5	D4	D3	D2	D1	D0
P0	P0	P0	P0	P0	P1	P1	P1	P1	P1	D	P2	P2	P2	P2	P2

Data is acquired through the operation of writing signal, and then written to the display RAM.

"X" are dummy bits, which are ignored for display, "D" are dither bits, which are used for dither.

(2) 3B3PD1 32 Gray Scale Display

1. 8-bit mode

D7	D6	D5	D4	D3	D2	D1	D0	
P0	P0	P0	P0	P0	D	X	X	1st write
P1	P1	P1	P1	P1	D	X	X	2nd write
P2	P2	P2	P2	P2	D	X	X	3rd write

A single pixel of data is read after the third write operation as shown, and it is written in the display RAM.

"X" are dummy bits, which are ignored for display, "D" are dither bits, which are used for dither.

2. 16 bit mode

D15	D14	D13	D12	D11	D10	D9	D8	D7	D6	D5	D4	D3	D2	D1	D0	
P0	P0	P0	P0	P0	D	X	X	P1	P1	P1	P1	P1	D	X	X	1st write
P2	P2	P2	P2	P2	D	X	X	X	X	X	X	X	X	X	X	2nd write

A single pixel of data is read after the second write operation as shown, and it is written in the display RAM.

"X" are dummy bits, which are ignored for display, "D" are dither bits, which are used for dither.

A single pixel of data is read after the second write operation as shown, and it is written in the display RAM.

"X" are dummy bits, which are ignored for display, "D" are dither bits, which are used for dither.

7.1.3 8-bit (4 line) and 9-bit (3 line) Serial Interface

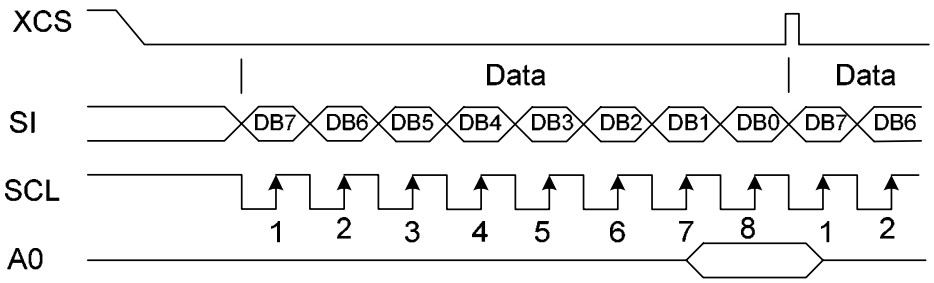
The 8-bit serial interface uses four pins XCS, SI, SCL, and A0 to enter commands and data. Meanwhile, the 9-bit serial interface uses three pins XCS, SI and SCL for the same purpose.

Data read is not available in the serial interface. The entered data must be 8 bits. Refer to the following chart for entering commands, parameters or gray-scale data.

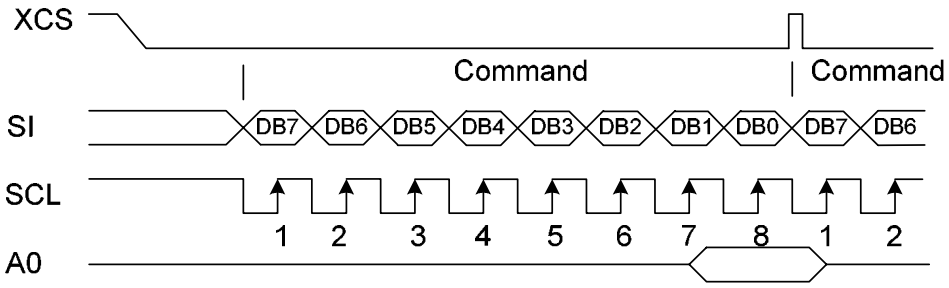
The relation between gray-scale data and data bus in the serial input is the same as that in the 8-bit parallel interface mode at every gradation.

(1) 8-bit serial interface (4 line)

When entering data (parameters): A0= HIGH at the rising edge of the 8th SCL.

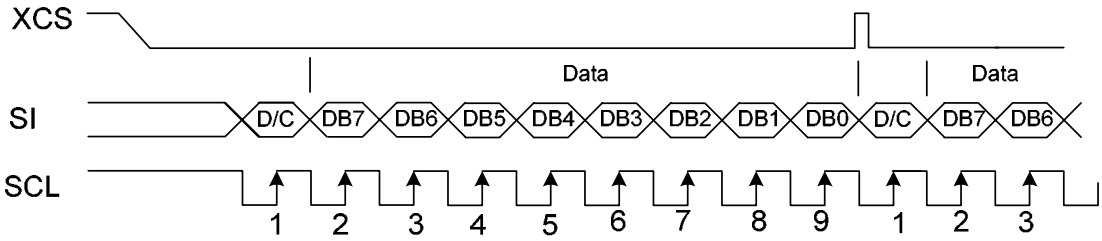


When entering command: A0= LOW at the rising edge of the 8th SCL

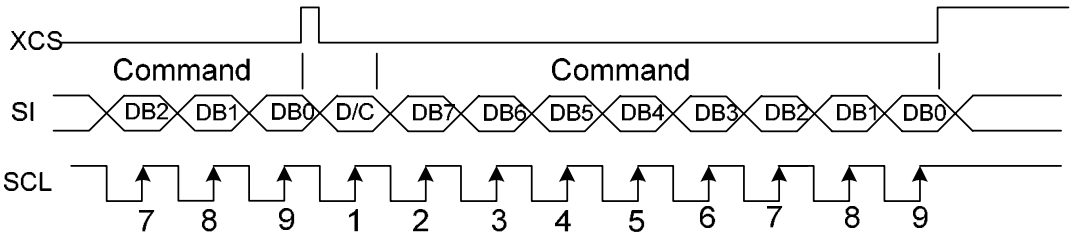


(2) 9-bit serial interface (3 line)

When entering data (parameters): SI= HIGH at the rising edge of the 1st SCL.



When entering command: SI= LOW at the rising edge of the 1st SCL.



- If XCS is set to HIGH while the 8 bits from D7 to D0 are entered, the data concerned is invalid. Before entering succeeding sets of data, you must correctly input the data concerned again.
- In order to avoid data transfer error due to incoming noise, it is recommended to set XCS at HIGH on byte basis to initialize the serial-to-parallel conversion counter and the register.
- When executing the command RAMWR, set XCS to HIGH after writing the last address (after starting the 9th pulse in case of 9-bit serial input or after starting the 8th pulse in case of 8-bit serial input).

7.1.4 IIC Interface

The IIC interface receives and executes the commands sent via the IIC Interface. It also receives RAM data and sends it to the RAM.

The IIC Interface is for bi-directional, two-line communication between different ICs or modules. The two lines are a Serial Data line (SDA) and a Serial Clock line (SCL). Both lines must be connected to a positive supply via a pull-up resistor. Data transfer may be initiated only when the bus is not busy.

BIT TRANSFER

One data bit is transferred during each clock pulse. The data on the SDA line must remain stable during the HIGH period of the clock pulse because changes in the data line at this time will be regarded as a control signal. Bit transfer is illustrated in Fig.7.1.4.1.

START AND STOP CONDITIONS

Both data and clock lines remain HIGH when the bus is not busy. A HIGH-to-LOW transition of the data line, while the clock is HIGH is defined as the START condition (S). A LOW-to-HIGH transition of the data line while the clock is HIGH is defined as the STOP condition (P). The START and STOP conditions are illustrated in Fig.7.1.4.2.

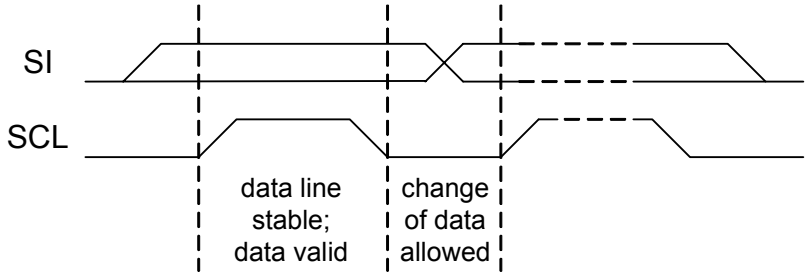


Fig .7.1.4.1 Bit transfer

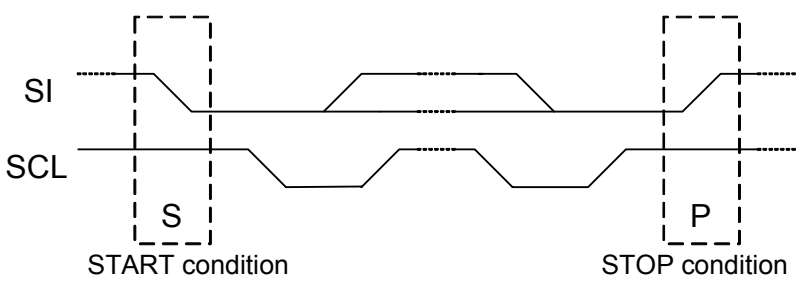

Fig .7.1.4.2 Definition of START and STOP conditions

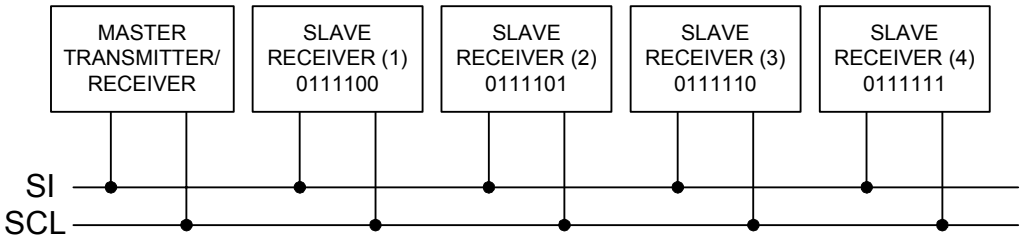

Fig .7.1.4.3 System configuration

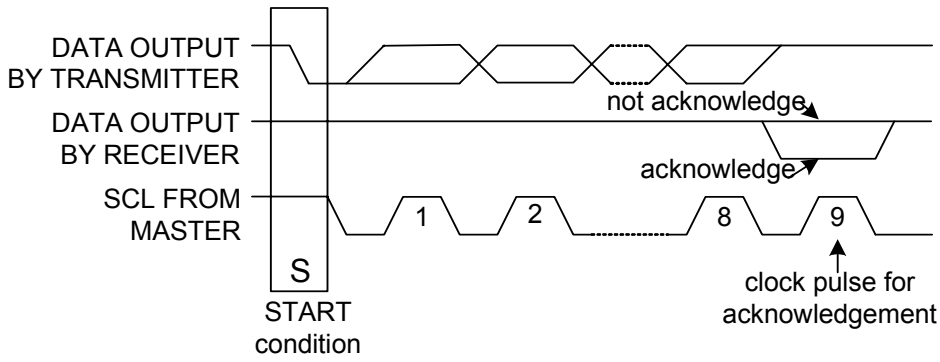

Fig .7.1.4.4 Acknowledgement on the 2-line Interface

SYSTEM CONFIGURATION

The system configuration is illustrated in Fig.7.1.4.3.

· Transmitter: the device, which sends the data to the bus

· Receiver: the device, which receives the data from the bus

· Master: the device, which initiates a transfer, generates clock signals and terminates a transfer

· Slave: the device addressed by a master

· Multi-Master: more than one master can attempt to control the bus at the same time without corrupting the message

· Arbitration: procedure to ensure that, if more than one master simultaneously tries to control the bus, only one is allowed to do so and the message is not corrupted

· Synchronization: procedure to synchronize the clock signals of two or more devices.

ACKNOWLEDGEMENT

Each byte of eight bits is followed by an acknowledge bit. The acknowledge bit is a HIGH signal put on the bus by the transmitter during which time the master generates an extra acknowledge related clock pulse. A slave receiver which is addressed must generate an acknowledgement after the reception of each byte. A master receiver must also generate an acknowledgement after the reception of each byte that has been clocked out of the slave transmitter. The device that acknowledges must pull-down the SDA line during the acknowledge clock pulse, so that the SDA line is stable LOW during the HIGH period of the acknowledgement related clock pulse (set-up and hold times must be taken into consideration). A master receiver must signal an end-of-data to the transmitter by not generating an acknowledgement on the last byte that

has been clocked out of the slave. In this case, the transmitter must leave the data line HIGH to enable the master to generate a STOP condition. Acknowledgement on the IIC Interface is illustrated in Fig.7.1.4.4.

IIC Interface protocol

The ST7529 supports command, data write addressed slaves on the bus.

Before any data is transmitted on the IIC Interface, the device, which should respond, is addressed first. Four 7-bit slave addresses (0111100, 0111101, 0111110 and 0111111) are reserved for the ST7529. The least significant bit of the slave address is set by connecting the input SA0 and SA1 to either logic 0 (VSS)or logic 1 (VDD).

The IIC Interface protocol is illustrated in Fig.7.1.4.5.

The sequence is initiated with a START condition (S) from the IIC Interface master, which is followed by the slave address. All slaves with the corresponding address acknowledge in parallel, all the others will ignore the IIC Interface transfer. After acknowledgement, one or more command words follow which define the status of the addressed slaves.

A command word consists of a control byte, which defines Co and A0, plus a data byte.

The last control byte is tagged with a cleared most significant bit (i.e. the continuation bit Co). After a control byte with a cleared Co bit, only data bytes will follow. The state of the A0 bit defines whether the data byte is interpreted as a command or as RAM data. All addressed slaves on the bus also acknowledge the control and data bytes. After the last control byte, depending on the A0 bit setting; either a series of display data bytes or command data bytes may follow. If the A0 bit is set to logic 1, these display bytes are stored in the display RAM at the address specified by the data pointer. The data pointer is automatically updated and the data is directed to the intended ST7529 device. If the A0 bit of the last control byte is set to logic 0, these command bytes will be decoded and the setting of the device will be changed according to the received commands. Only the addressed slave makes the acknowledgement after each byte. At the end of the transmission the IIC INTERFACE-bus master issues a STOP condition (P).If the R/W bit is set to logic 1 the chip will output data immediately after the slave address if the A0 bit, which was sent during the last write access, is set to logic 0. If no acknowledge is generated by the master after a byte, the driver stops transferring data to the master.

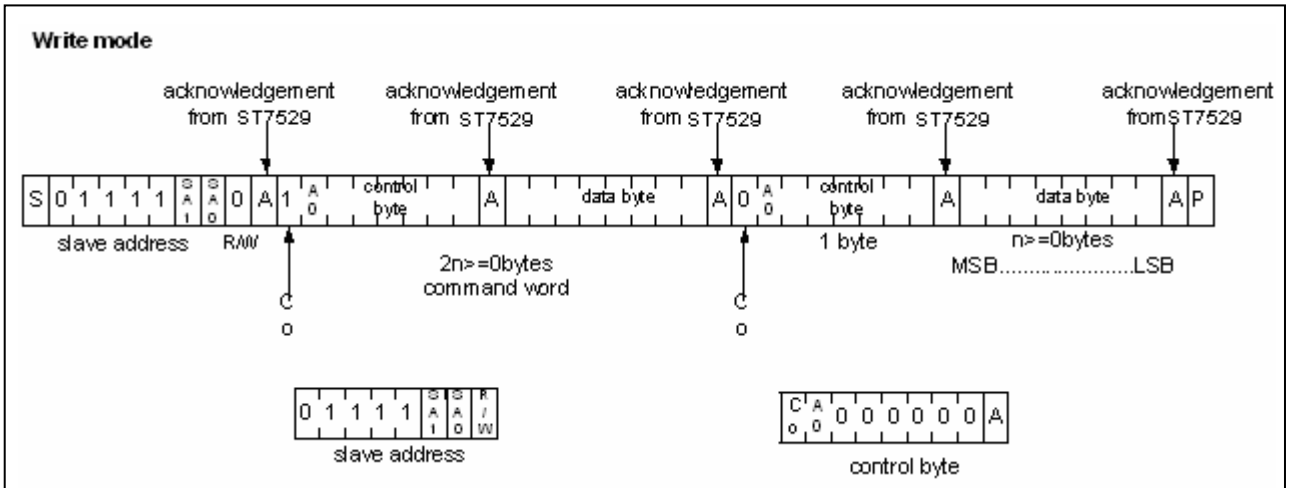

Fig .7.1.4.5 2-line Interface protocol

Co	0	Last control byte to be sent. Only a stream of data bytes is allowed to follow. This stream may only be terminated by s STOP or RE-START condition.
	1	Another control byte will follow the data byte unless a STOP or RE-START condition is received.

7.2 ACCESS TO DDRAM AND INTERNAL REGISTERS

Since ST7529 access from MPU by pipeline processing via the bus holder attached to the internal that requires only the cycle time but no waiting time, it can achieves high-speed data transfer.

For example, when MPU writes data to the DDRAM, the data is once held by the bus holder and then written to the DDRAM before the succeeding write cycle start. When MPU reads data from the DDRAM, the first read cycle is dummy and the data read in the dummy cycle is held by the bus holder, and then it read from the bus holder to the system bus in the succeeding read cycle. Fig. 7.2.1 illustrates these relations.

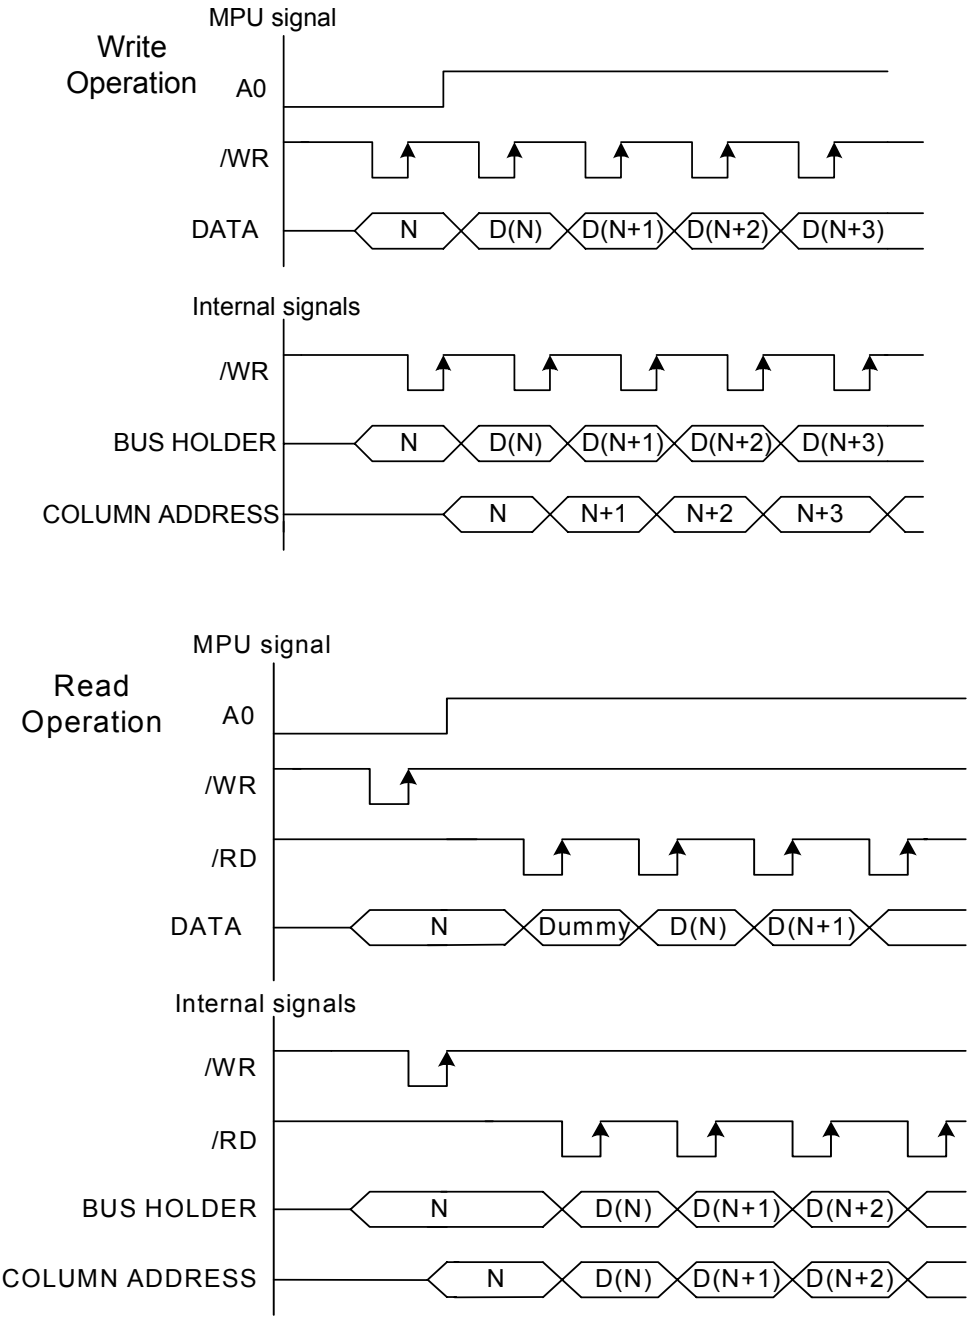

Fig 7.2.1

7.3 DISPLAY DATA RAM (DDRAM)

7.3.1 DDRAM

It is 160 X 256 X 5 bits capacity RAM prepared for storing dot data. You can access a desired bit by specifying the LINE address and column address. Since the display data from MCU D7 to D0 and D15 to D8 correspond to one or two pixels, data transfer related restrictions are reduced, and the display would be flexible.

The RAM on ST7529 is separated to a block per 4 lines to allow the display system to process data on the block basis.

The reading and writing RAM operations of MPU are performed via the I/O buffer circuit. Reading of the RAM for the liquid crystal drive is controlled from another separate circuit.

Refer to the following memory map for the RAM configuration.

$Dk_{i,j}$ is the k^{th} data bit of the i^{th} write for pixel j, and $Dk'_{i,j}$ is the k^{th} data bit of the i^{th} write for pixel j after dithering or truncating.

7.3.2 Line Address Control Circuit

This circuit is to control the address in the line direction when MPU accesses the DDRAM or read the DDRAM to display image on the LCD.

You can specify a range of the line address with line address set command. When the line-direction scan is specified with DATACTRL command and the address are increased from the start up to the end line, the column address is increased by 1 and the line address returns to the start line.

The DDRAM supports up to 160 lines, and thus the total line becomes 160.

In the READ operation, as the end line is reached, the column address is automatically increased by 1 and the line address returns to the start line.

Users may inverse the correspondence between the DDRAM address and common output via the address normal/inverse parameter of DATACTRL command.

7.3.3 Column Address Control Circuit

This circuit is to control the address in the column direction when MPU accesses the DDRAM. You can specify a range of the column address with column address set command. When the column-direction scan is specified with DATACTRL command and the address are increased from the start up to the end line, the line address is increased by 1 and the column address returns to the start column.

In the READ operation, the column address is also automatically increased by 1 and returns to the start line as the end column is reached.

Just like the line address control circuit, users may inverse the correspondence between the DDRAM column address and segment output via the column address normal/inverse parameter of DATACTRL command. This arrangement makes the chip layout on the LCD module flexible.

7.3.4 I/O Buffer Circuit

It is the bi-directional buffer when MPU reads or writes the DDRAM. Since the READ or WRITE operation of MPU to DDRAM is performed independently from data output to the display data latch circuit, asynchronous access to the DDRAM while the LCD is turned on does not cause troubles such as flicking of the display images.

7.3.5 Block Address Circuit

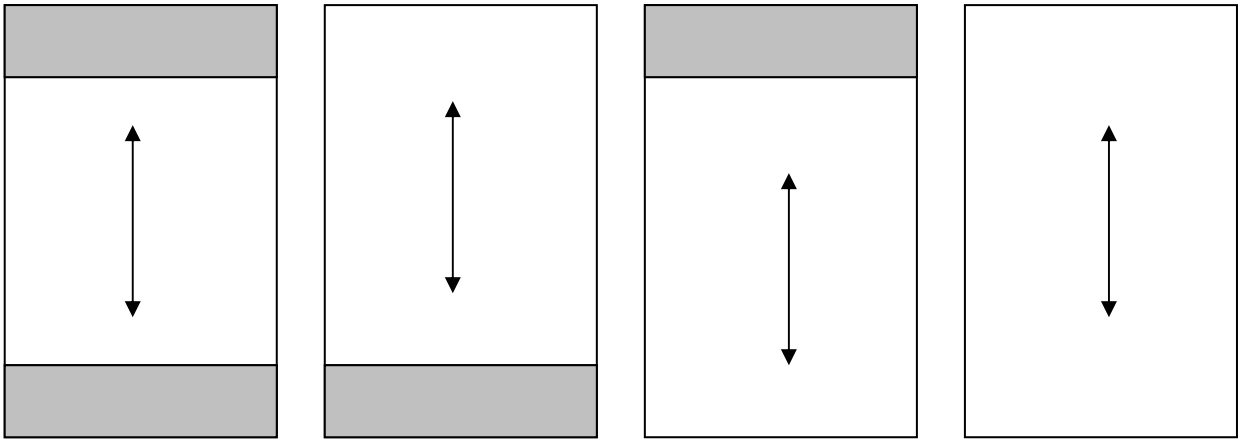
The circuit associates lines on DDRAM with COM output. ST7529 processes signals for the liquid crystal display on 4-line basis. Thus, when specifying a specific area in the area of scroll display or partial display, you must designate it in block.

7.3.6 Display Data Latch Circuit

This circuit is used to temporarily hold display data to be output from the DDRAM to the SEG decoder circuit. Since display normal/inverse and display on/off commands are used to control data in the latch circuit alone, they do not modify data in the DDRAM.

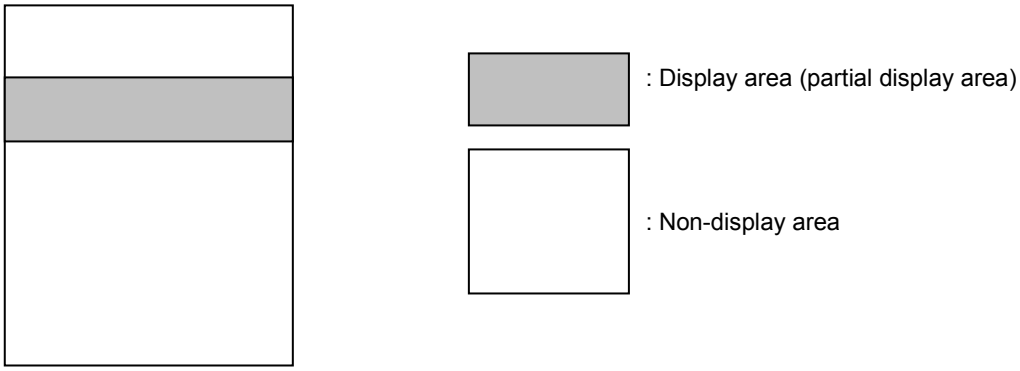
7.4 Area Scroll Display

The user may scroll the display screen partially in any one of the following four scroll patterns via AREA SCROLL SET and SCROLL START SET commands.



7.5 Partial Display

The user may turn on the partial display (division by line) of the screen via PARTIAL IN command. This mode consumes less current than the whole screen display and is suitable for the equipment in the standby state.



If the partial display region is out of the maximum display range, it will be no operation.

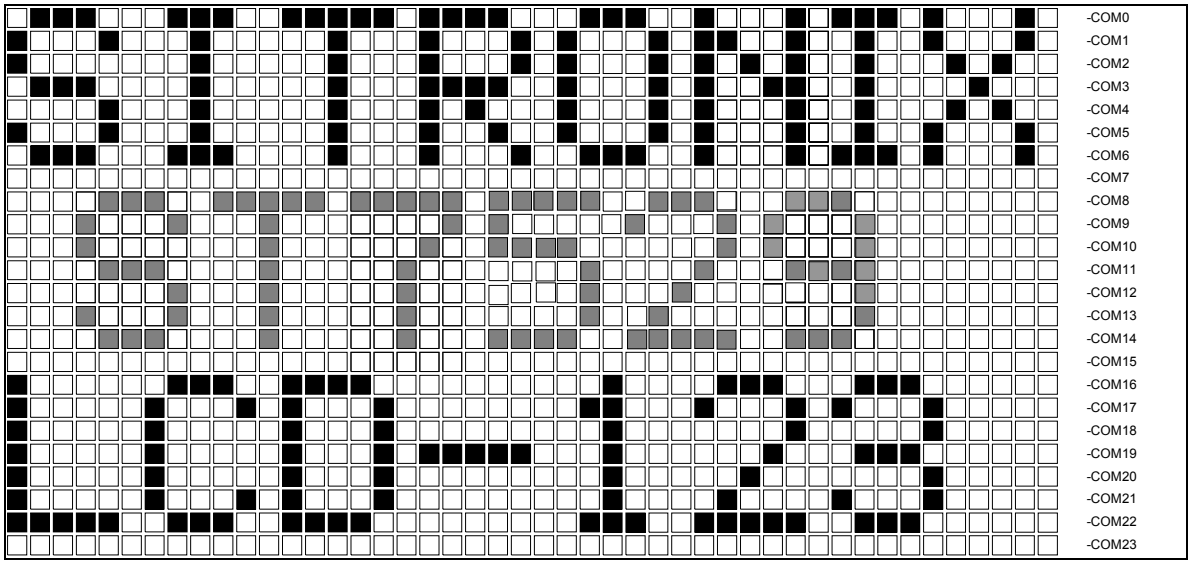


Figure 7.5.1.Reference Example for Partial Display

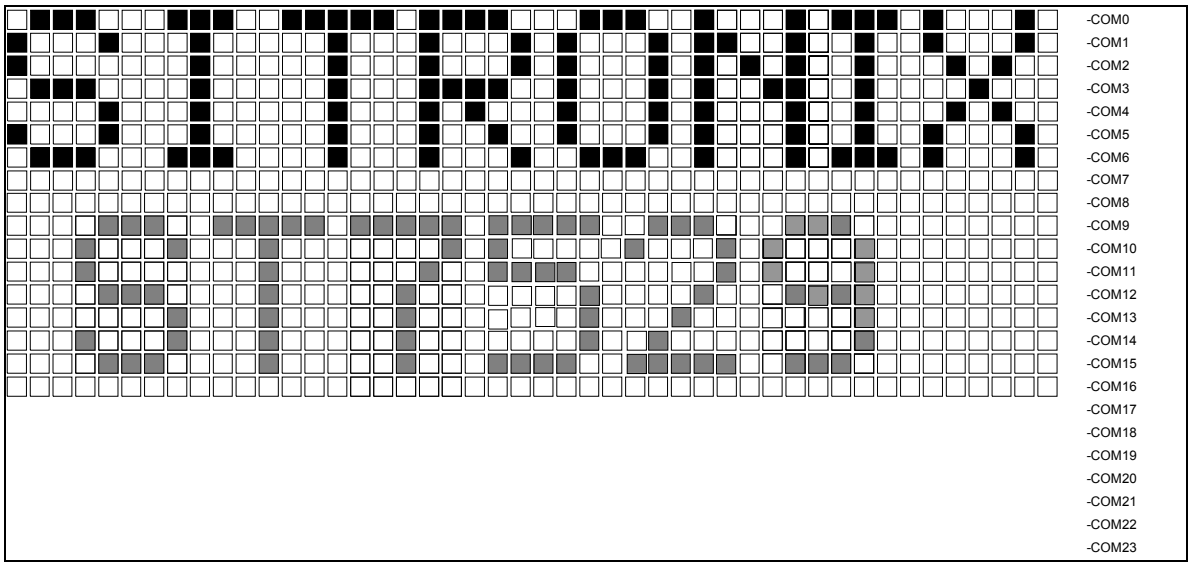

Figure 7.5.2.Partial Display

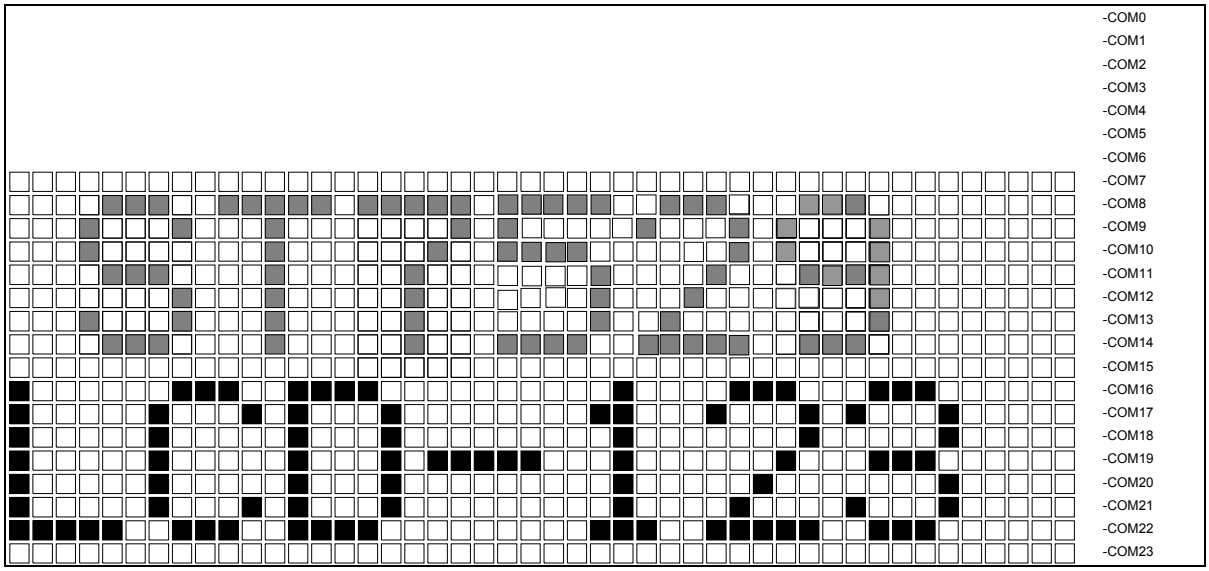

Figure 7.5.3.Moving Display

7.6 Gray-Scale Display

ST7529 incorporates a 2 FRC & 31 PWM function circuit to display a 32 gray-scale display.

7.7 Oscillation Circuit

This is an on-chip oscillator without external resistor. When the internal oscillator is used, this pin must connect to VDD; when the external oscillator is used, this pin could be an input pin. This oscillator signal is used in the voltage converter and display timing generation circuit.

7.8 Display Timing Generator Circuit

This circuit generates some signals for displaying on LCD. The display clock, CL (internal), generated by oscillation clock, generates the clock for the line counter and the signal for the display data latch. The line address of on-chip RAM is generated in synchronization with the display clock and the display data latch circuit latches the 160-bit display data in synchronization with the display clock. The display data, which is read to the LCD driver, is completely independent of the access to the display data RAM from the MPU. The display clock generates an LCD AC signal (M) which enables the LCD driver to make an AC drive waveform. It also generates an internal common timing signal and start signal to the common driver. The frame signal or the line signal changes the M by setting internal instruction. Driving waveform and internal timing signal are shown in Figure 7.8.1.

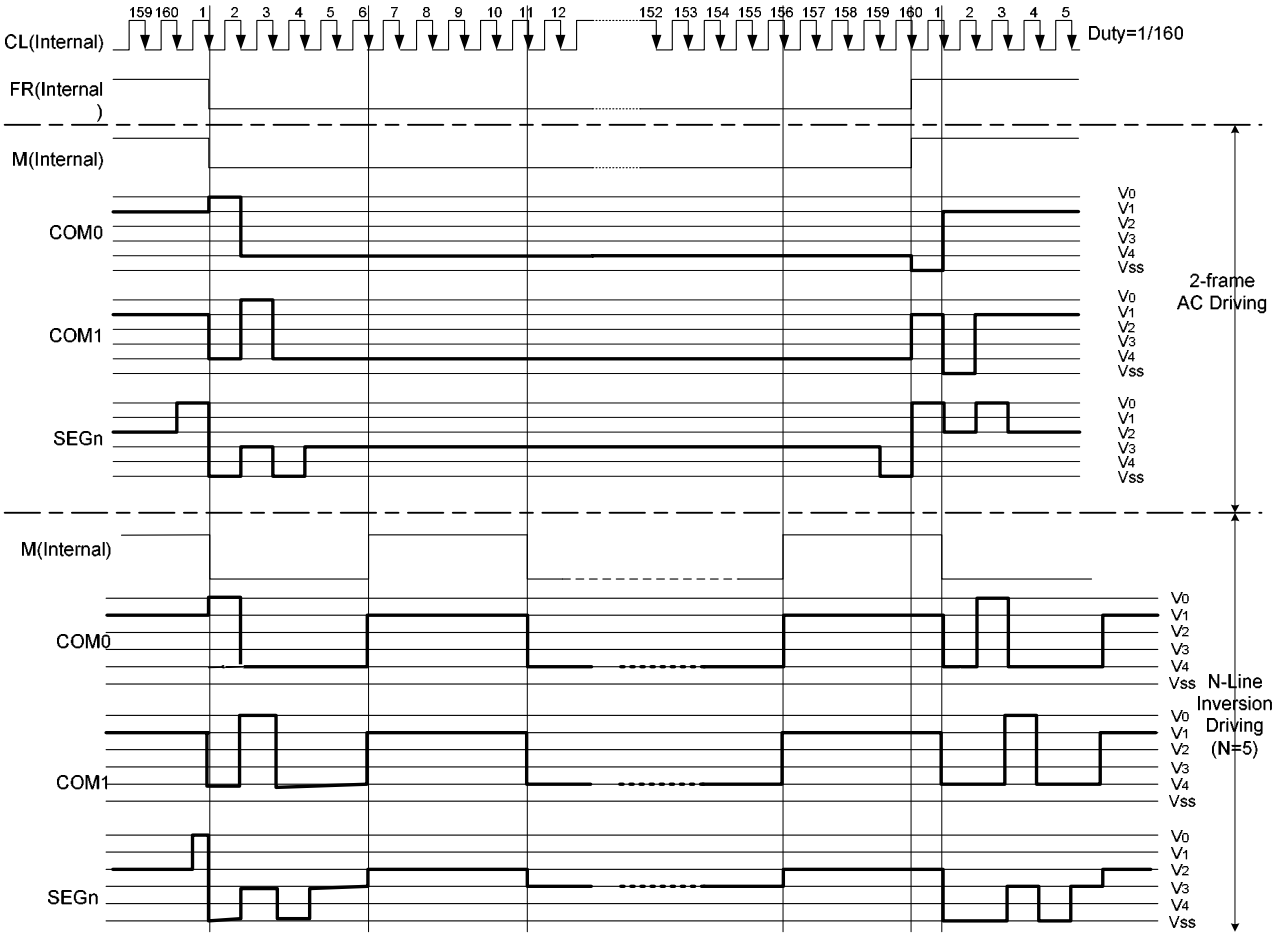

Figure 7.8.1 2-frame AC Driving Waveform (Duty Ratio: 1/160)

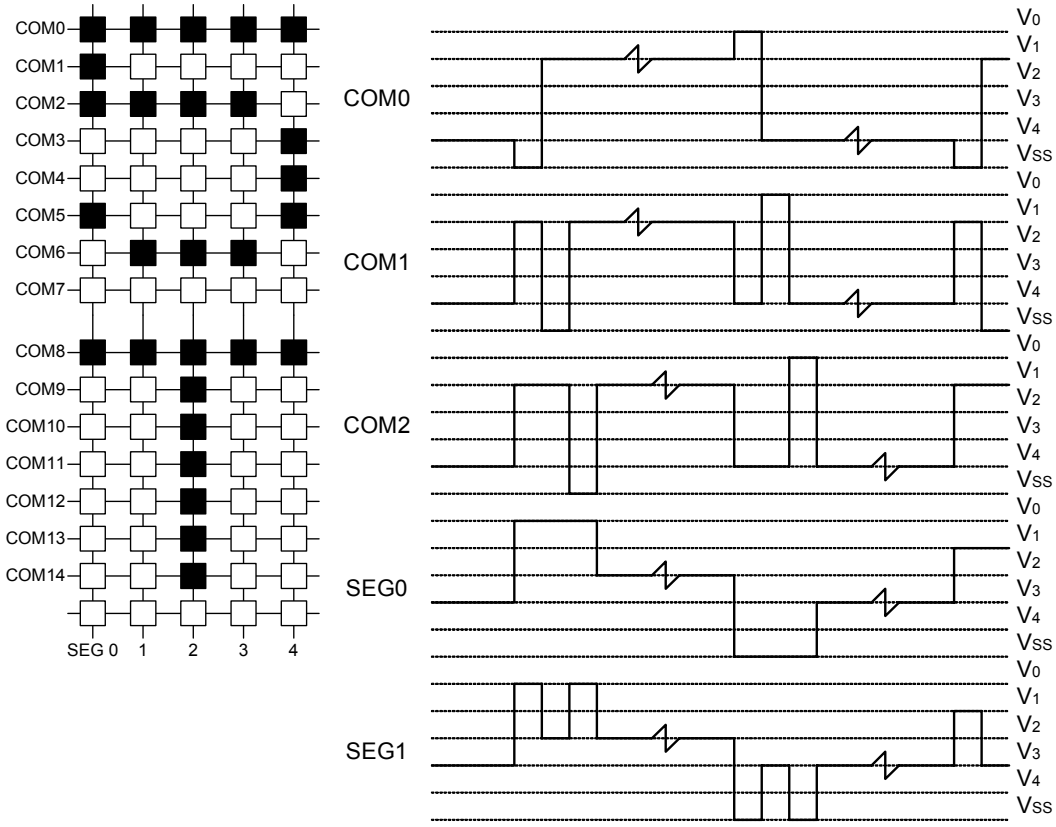
7.9 Liquid Crystal drive Circuit

This driver circuit is configured by 160-channel common drivers and 256-channel segment drivers. This LCD panel driver voltage depends on the combination of display data and M signal.



7.10 Liquid Crystal Driver Power Circuit

The power supply circuit generates the voltage levels required to drive liquid crystal driver with low power consumption and the fewest components. There are voltage converter circuits, voltage regulator circuits, and voltage follower circuits. They are controlled by power control instruction. For details, refers to "Instruction Description". Table 7.10.1 shows the referenced combinations in using Power Supply circuits.

Table 7.10.1 Recommended Power Supply Combinations

User setup	Power control (VB VR VF)	V/B circuits	V/R circuits	V/F circuits	VLCD	V0	V1 to V4

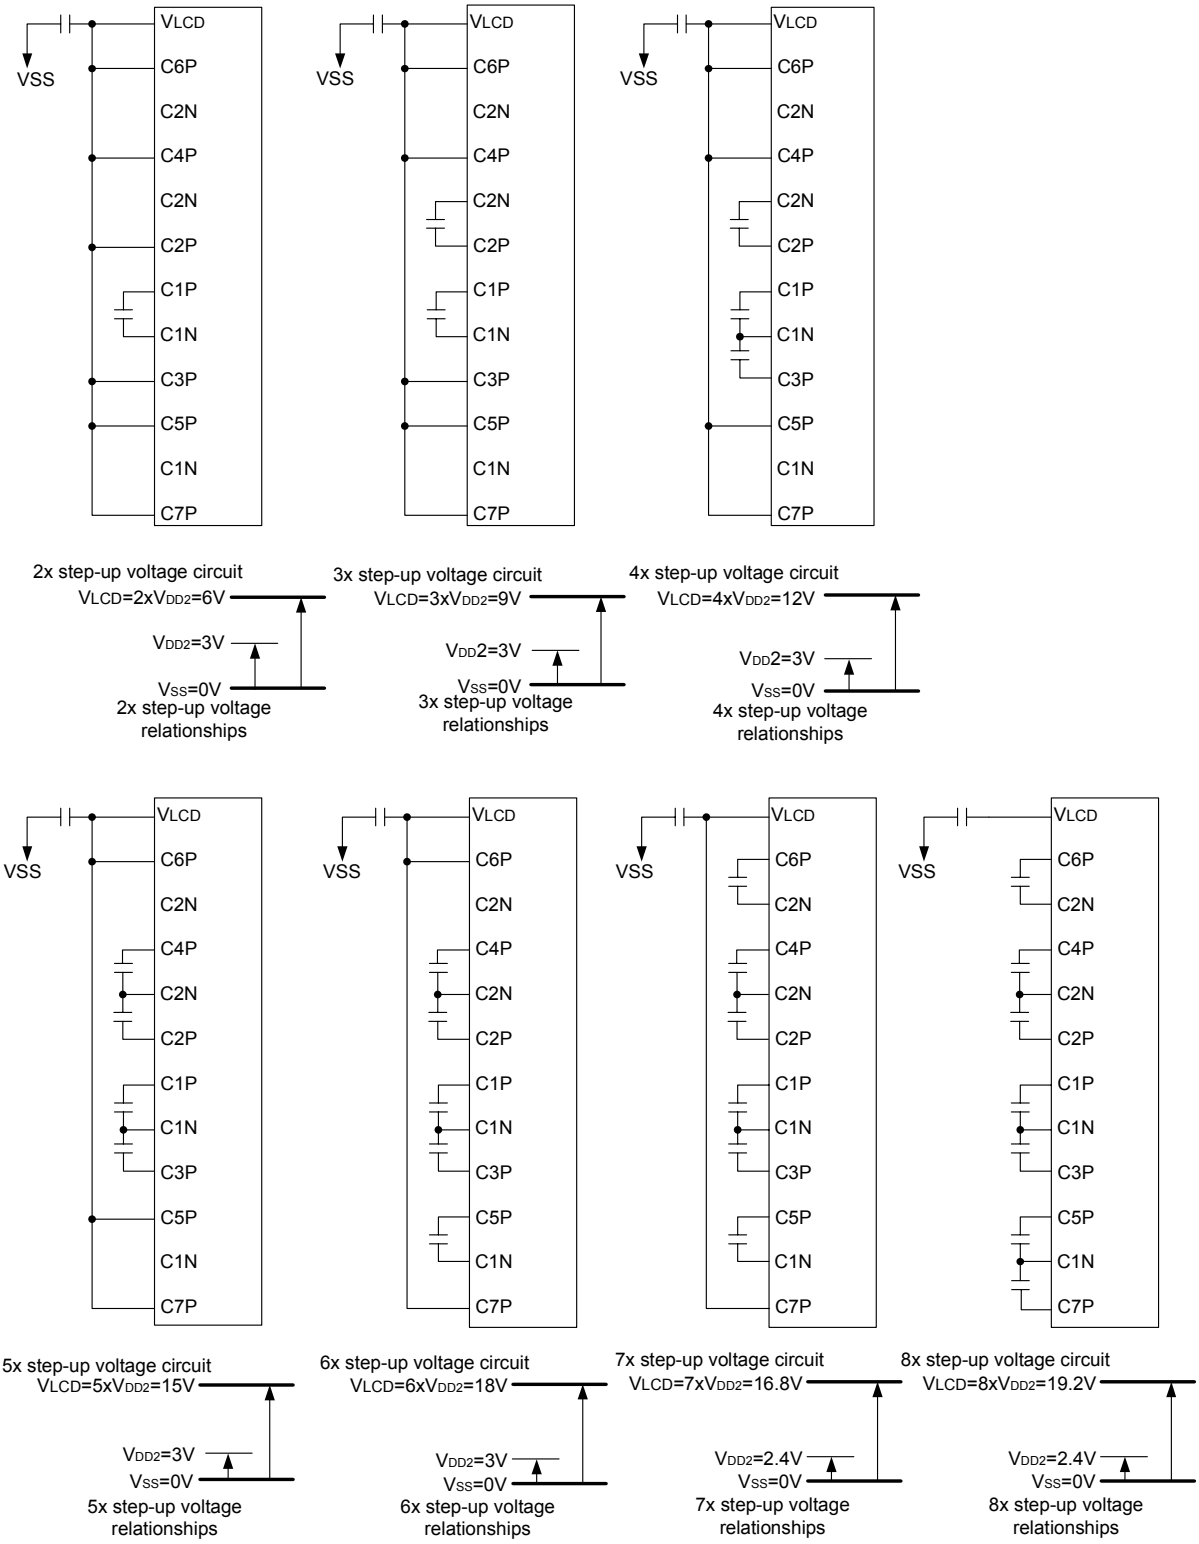
7.10.1 Voltage Converter Circuits

The Step-up Voltage Circuits



Note: The regulating capacitance on V0 ~ V4 should be between 1.0 to 2.2 µF.

7.10.2 Voltage Regulator Circuits

SET VOP (SETVOP)

The set V_{OP} function is to program the optimum LCD supply voltage V_0.

SETVOP

Reset state of VPR[8:0] is 257_{DEC} = 13.88V.

The V_0 value is programmed via the VPR[8:0] register.

V_0 = a + (VPR[8:6]VPR[5:0]) x b

Ex: VPR[5:0]=000001, VPR[8:6]=100

→ VPR[8:0]=100000001

→ 3.6+257x0.04=13.88

where a is a fixed constant value 3.6, b is a fixed constant value 0.04, VPR[8:0] is the programmed V_0 value with programming range from 5 to 410 ($19A_{HEX}$), and VPR[5:0] is the set contrast value which can be set via the interface and is in two's complement format.(See command VOLUP & VOLDOWN)

The VPR[8:0] value must be in the V_0 programming range as given in Fig.7.10.2. Evaluating equation (1), values outside the programming range indicated in Fig.7.10.2 may result.

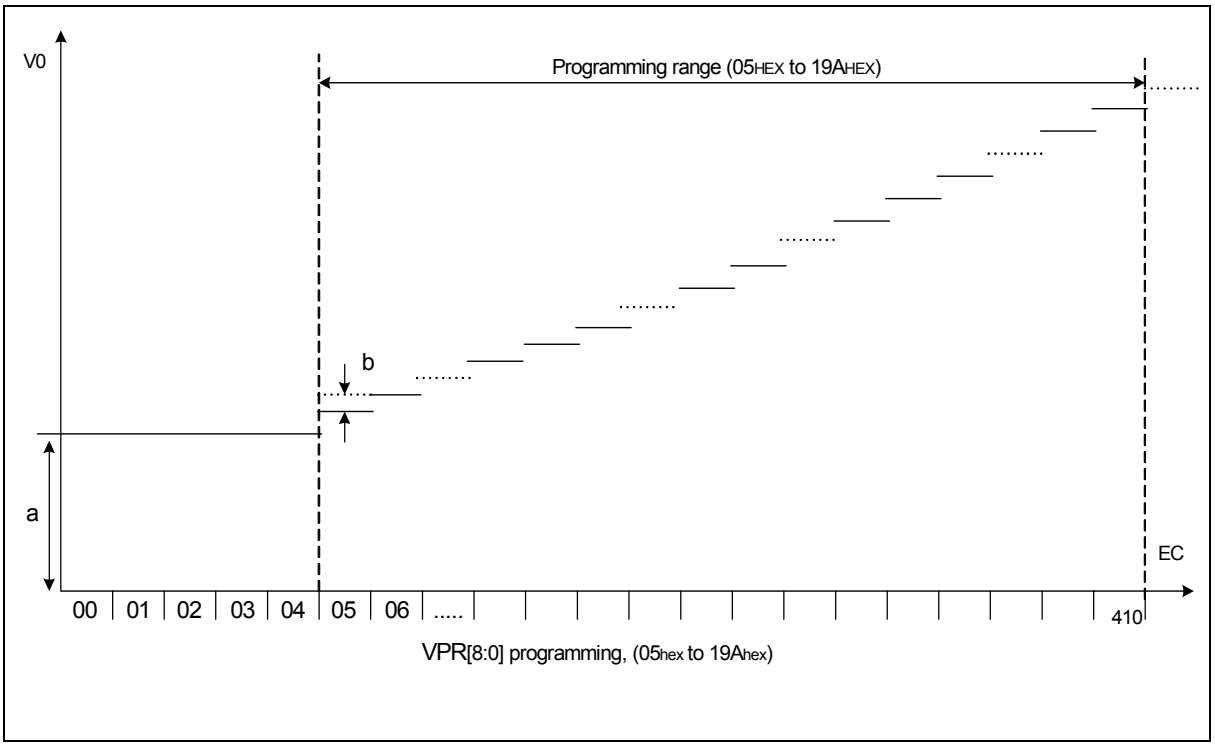


Fig. 7.10.2 V0 programming range

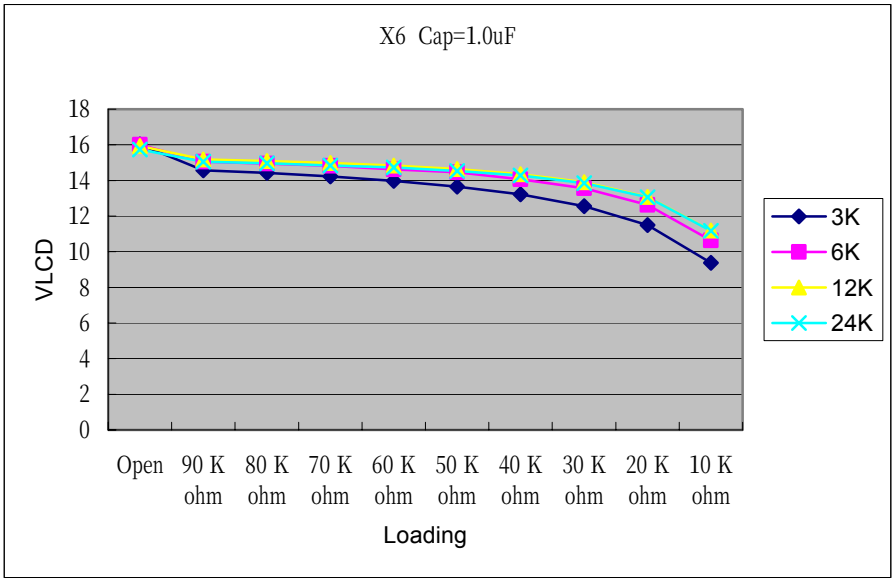
Although the programming range for the internally generated V_0 allows values above the maximum allowed V_0, the customer has to ensure setting the V_{PR} register and selecting the temperature compensation under all condition and including all tolerances that the maximum allowed V_0 (20V) will never be exceeded.

Booster Efficiency

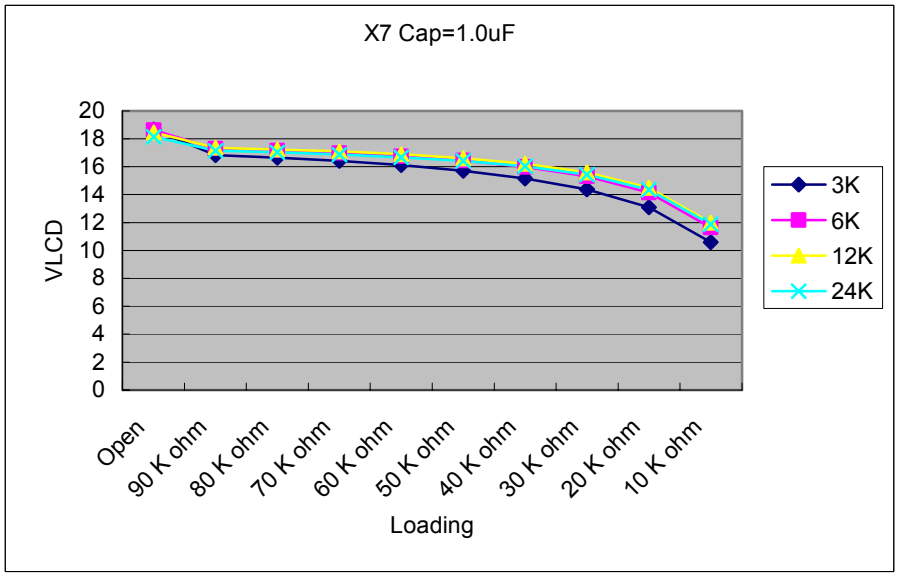
By BOOSTER STAGES (2X, 3X, 4X, 5X, 6X, 7X, 8X) and BOOSTER EFFICIENCY (Level1~4) commands, we could easily set the best booster performance with suitable current consumption. If the booster efficiency is set to higher level (level4 is higher than level1), the boost efficiency is better than lower level, and it only needs a little bit more power consumption current. It could be applied to each multiple voltage condition.

When the loading of LCD panel is heavier, the performance of booster will not be in a good working condition. The user may set the BE level to be higher and only a little bit more current needed. Never consider to change to higher booster stage at beginning stage unless it is necessary.

The BOOSTER EFFICIENCY command could be used together with BOOSTER STAGE command to choose one best boost output condition. The user could regard the BOOSTER STAGE command as a large scale operation, and the BOOSTER EFFICIENCY command as a small scale operation. These commands are very convenient for using.



Condition : VDD = 2.7V, Cap = 1.0uF, Booster = 6x, measured on chip



Condition : VDD = 2.7V, Cap = 1.0uF, Booster = 7x, measured on chip

Setting clock dividing ratio:	2 dividing
Duty setting:	1/4
Setting reverse rotation number of line:	11H reverse rotations
Common scan direction (COMSCN)	
Setting scan direction:	COM0 -> COM79, COM80-> COM159
Temperature Gradient Setting (TMPGRD)	

↓

Oscillation ON (OSCON)	Oscillation OFF

↓

Sleep-out (SLIPOUT)	Sleep-in

↓

<Power Supply Setting>	**<<State after resetting>>**
Electronic volume control (VOLCTRL)	
Setting volume value:	0
Setting built-in resistance value:	0 (3.95)
Power control (PWRCTR)	
Setting operation of power supply circuit:	All OFF

↓

<Display Setting 2>	**<<State after resetting>>**
Normal rotation of display (DISNOR)/Inversion of display (DISINV): Normal rotation of display	
Partial-in (PTLIN)/Partial-out (PTLOUT)	Partial-out
Setting fix area:	0
Area scroll set (ASSET)	
Setting area scroll region:	0
Setting area scroll type:	Full-screen scroll
Scroll start set (SCSTART)	
Setting scroll start address:	0

↓

<Display Setting 3>	**<<State after resetting>>**
Data control (DATCTRL)	
Setting normal rotation/inversion of line address:	Normal rotation

Setting normal rotation/inversion of column address: Normal rotation

Setting direction of address scanner: Column direction

Setting gradation: 2B3P mode

↓

<RAM Setting> **<<State after resetting>>**

Line address set (LASET)

Setting start line address: 0

Setting end line address: 0

Column address set (CASET)

Setting start column address: 0

Setting end column address: 0

↓

<RAM Write> **<<State after resetting>>**

Memory write command (RAMWR)

Writing displayed data: Repeat as many as the number needed and exit by entering other command.

↓

<Waiting (approximately 100ms)>

Wait until the power supply voltage has stabilized.

Enter the command of power supply control first, and then wait at least 100ms before entering the display ON command when the built-in power supply circuit operates.

If you do not wait, an unexpected display may appear on the liquid crystal panel.

↓

DISPLAY ON (DISON): DISPLAY OFF

*1: When the IC is in SLEEP IN state, the liquid crystal drive power supply, the boosting power output, and GND pin are connected together, therefore, the SLEEP OUT command must be entered to cancel the SLEEP state prior to turning on the built-in circuit.

(Note) If changes are unnecessary after resetting, command input is unnecessary.

8. COMMANDS

8.1 Command table

Ext=0 or Ext=1

Index	Command	A0	RD	WR	D7	D6	D5	D4	D3	D2	D1	D0	Function	Hex	Parameter

Note: The table above is for 8-bit interface. For the application of 16-bit interface, fill D15~8 with 0, and other bits are just the same with the table above.

EXT= "0" or "1"

(1) Extension instruction disable (EXT IN) - Parameter Byte: None (30H)

Use the "EXT=0" command table

	A0	RD	WR	D7	D6	D5	D4	D3	D2	D1	D0
Command	0	1	0	0	0	1	1	0	0	0	0

(2) Extension instruction enable (EXT OUT) - Parameter Byte: None (31H)

Use the extended command table EXT="1"

	A0	RD	WR	D7	D6	D5	D4	D3	D2	D1	D0
Command	0	1	0	0	0	1	1	0	0	0	1

EXT= "0"

(1) Display ON (DISON) - Parameter Byte: None (AFH)

It is to turn the display on. When the display is turned on, segment and common outputs are generated at the level corresponding to the display data and display timing. As long as the sleep mode is selected, the display cannot be turned on. Thus, whenever using this command, the sleep mode must be cancelled first.

	A0	RD	WR	D7	D6	D5	D4	D3	D2	D1	D0
Command	0	1	0	1	0	1	0	1	1	1	1

(2) Display OFF (DISOFF) - Parameter Byte: None (AEH)

It is to forcibly turn the display off. As long as the display is turned off, every segment and common outputs are forced to VSS level.

	A0	RD	WR	D7	D6	D5	D4	D3	D2	D1	D0
Command	0	1	0	1	0	1	0	1	1	1	0

(3) Normal display (DISNOR) - Parameter Byte: None (A6H)

It is to normally highlight the display area without modifying contents of the display data RAM.

	A0	RD	WR	D7	D6	D5	D4	D3	D2	D1	D0
Command	0	1	0	1	0	1	0	0	1	1	0

(4) Inverse display (DISINV) - Parameter Byte: None (A7)

It is to inversely highlight the display area without modifying contents of the display data RAM. This command does not invert non-display areas in case of using partial display.

	A0	RD	WR	D7	D6	D5	D4	D3	D2	D1	D0
Command	0	1	0	1	0	1	0	0	1	1	1

(5) Common scan (COMSCN) - Parameter Byte: 1 (BBH)

It is to specify the common output scan direction. This command is for the convenience of wiring on the LCD panel.

	A0	RD	WR	D7	D6	D5	D4	D3	D2	D1	D0	Function
Command	0	1	0	1	0	1	1	1	0	1	1	—
Parameter Byte 1 (PB1)	1	1	0	*	*	*	*	*	CD2	CD1	CD0	Common Scan direction

When 1/160 is selected for the display duty, pins and common output are scanned in the order shown below.

CD2	CD1	CD0	Common scan direction					
			COM0 pin		COM79 pin	COM69 pin		COM132 pin
0	0	0	0	→	79	80	→	159
0	0	1	0	→	79	159	→	80
0	1	0	79	→	0	80	→	159
0	1	1	79	→	0	159	→	80

(6) Display control (DISCTRL) - Parameter Byte: 3 (CAH)

This command and succeeding parameters are used to perform the display timing-related setups. This command must be selected before using SLPOUT. Do not change this command while the display is turned on.

	A0	RD	WR	D7	D6	D5	D4	D3	D2	D1	D0	Function
Command	0	1	0	1	1	0	0	1	0	1	0	
Parameter Byte 1 (PB1)	1	1	0	*	*	*	0	0	CLD	0	0	CL dividing ratio, F1 and F2 drive pattern.
Parameter Byte 2 (PB2)	1	1	0	*	*	DT5	DT4	DT3	DT2	DT1	DT0	Drive duty
Parameter Byte 3 (PB3)	1	1	0	*	*	*	FI	LF3	LF2	LF1	LF0	FR inverse-set value

PB1 specifies the CL dividing ratio.

CLD: CL dividing ratio. They are used to change number of dividing stages of external or internal clock.

CLD=0: not divide, CLD=1: 2 divisions.

PB2 specifies the duty of the module on block basis. Initial: 00H

(Numbers of display lines)/4-1 = DT5 x 2^5 + DT4 x 2^4 + DT3 x 2^3 + DT2 x 2^2 + DT1 x 2^1 + DT0 x 2^0

For example, 1/128 duty → 128/4-1=31 → (DT5, DT4, DT3, DT2, DT1, DT0) = (0, 1, 1, 1, 1, 1)

PB3 specifies number of line cycles (range from 2 to 16) in a frame.

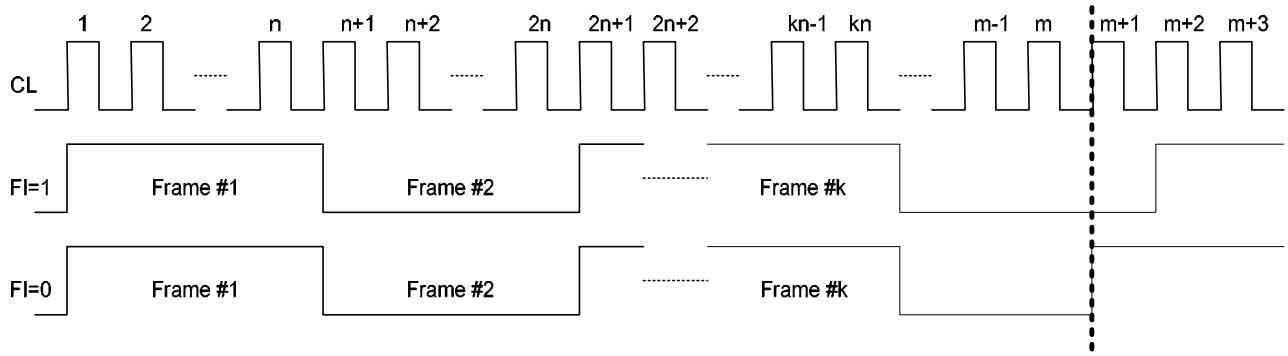
Number of line cycles-1 = LF3 x 2^3 + LF2 x 2^2 + LF1 x 2^1 + LF0 x 2^0

For example, 11 line cycles in a frame → 11-1=10 → (LF3, LF2, LF1, LF0) = (1, 0, 1, 0)

In the default, 11 line cycles in a frame is selected.

FI decides the inversion type of frame at the end of common scan cycle while the number of duty is not divisible by the number of line cycles per frame. For example, in the application of 1/m duty and n line cycles in a frame set, the difference of the choice in FI is shown as the following figure.

m = n x k + r, where m, n, k, and r are all whole numbers, and r is the remainder of m divided by n (r < n).



(7) Sleep in (SLPIN) - Parameter Byte: None (95H)

This command is to enter the SLEEP MODE.

	A0	RD	WR	D7	D6	D5	D4	D3	D2	D1	D0
Command	0	1	0	1	0	0	1	0	1	0	1

(8) Sleep out (SLPOUT) - Parameter Byte: None (94H)

This command is to exit the SLEEP MODE.

	A0	RD	WR	D7	D6	D5	D4	D3	D2	D1	D0
Command	0	1	0	1	0	0	1	0	1	0	0

(9) Line address set (LASET) - Parameter Byte: 2 (75H)

This command is to specify the line address area when MPU makes access to the display data RAM. As the addresses are increased from the start to the end line in the line-direction scan, the column address is increased by 1 and the line address return to the start line. Note that the start and end line must be a pair. Moreover, the relation “start line <end line” must be maintained.

	A0	**RD**	**WR**	**D7**	**D6**	**D5**	**D4**	**D3**	**D2**	**D1**	**D0**	**Function**
Command	0	1	0	0	1	1	1	0	1	0	1	—
Parameter Byte 1 (PB1)	1	1	0	SL7	SL6	SL5	SL4	SL3	SL2	SL1	SL0	Start Line
Parameter Byte 2 (PB2)	1	1	0	EL7	EL6	EL5	EL4	EL3	EL2	EL1	EL0	End Line

Note: The range of line address is 0 ~ 159.

(10) Column address set (CASET) - Parameter Byte: 2 (15H)

This command is to specify the column address area when MPU makes access to the display data RAM. As the addresses are increased from the start to the end column in the column-direction scan, the line address is incremented by 1 and the column address is returned to the start column. Note that the start and end line must be a pair. Moreover, the relation “start column <end column” must be maintained.

	A0	**RD**	**WR**	**D7**	**D6**	**D5**	**D4**	**D3**	**D2**	**D1**	**D0**	**Function**
Command	0	1	0	0	1	1	1	0	1	0	1	—
Parameter Byte 1 (PB1)	1	1	0	SC7	SC6	SC5	SC4	SC3	SC2	SC1	SC0	Start Column
Parameter Byte 2 (PB2)	1	1	0	EC7	EC6	EC5	EC4	EC3	EC2	EC1	EC0	End Column

Note: The range of column address is 0 ~ 84.

(11) Data scan direction (DATSDR) - Parameter Byte: 3 (BCH)

This command is to setup various parameters in the operations of display data stored on the built-in RAM by MPU.

	A0	RD	WR	D7	D6	D5	D4	D3	D2	D1	D0	Function
Command	0	1	0	1	0	1	1	1	1	0	0	—
Parameter Byte 1 (PB1)	1	1	0	*	*	*	*	*	C/L	CI	LI	Normal/inverse display of address and address scan direction.
Parameter Byte 2 (PB2)	1	1	0	*	*	*	*	*	*	*	0	Not used, D0 must be 0.
Parameter Byte 3 (PB3)	1	1	0	*	*	*	*	*	GS2	GS1	GS0	Gray-scale setup

PB1 is to specify the normal/inverse display of the line and column address and the address scanning direction.

LI: Normal/inverse direction of the line address. LI =0: Normal, LI =1: Inverse

CI: Normal/reverse direction of the column address. CI =0: Normal, CI =1: Reverse

C/L: Address-scan direction. C/L =0: In the column direction, C/L =1: In the line direction

PB2 is not used, Do must be 0.

PB3 is to select desired gray scale display mode 2B3P or 3B3PD1 or 3B3PD2 mode.

GS2	GS1	GS0	Numbers of gray-scale
0	0	1	32 gray-scale 2Byte 3Pixel mode
0	1	0	32 gray-scale 3Byte 3Pixel dither 1 mode
1	0	0	32 gray-scale 3Byte 3Pixel dither 2 mode

(12) Memory write (RAMWR) - Parameter Byte: Numbers of data written (5CH)

This command turns on the data entry mode when MPU writes data to the display memory. This command will always sets the line and column address at the start address while executed. The following parameter byte rewrites contents of the display data RAM and increases the line or column address automatically. The write mode is automatically cancelled if any other command is entered.

1. 8-bit bus

	A0	RD	RW	D7	D6	D5	D4	D3	D2	D1	D0	Function
Command	0	1	0	0	1	0	1	1	1	0	0	—
Parameter Byte 1 (PB1)	1	1	0	Data to be written								Data to be written

2. 16-bit bus

	A0	RD	RW	D15	D14	…	D9	D8	D7	D6	D5	D4	D3	D2	D1	D0	Function
Command	0	1	0	*	*	…	*	*	0	1	0	1	1	1	0	0	Memory write
Parameter Byte 1 (PB1)	1	1	0	Data to be written													Write date

(13) Memory read (RAMRD) - Parameter Byte: Numbers of data read (5DH)

This command turns on the data read mode when MPU read data from the display memory. This command will always sets the line and column address at the start address while executed. The contents of the display data RAM will be read in the following parameter byte and increases the line or column address automatically. The data read mode is automatically cancelled if any other command is entered.

1. 8-bit bus

	A0	RD	RW	D7	D6	D5	D4	D3	D2	D1	D0	Function
Command	0	1	0	0	1	0	1	1	1	0	1	--
Parameter Byte 1 (PB1)	1	0	1	Data to be read								Data to be read

2. 16-bit bus

	A0	RD	RW	D15	D14	….	D9	D8	D7	D6	D5	D4	D3	D2	D1	D0	Function
Command	0	1	0	*	*	*	*	*	0	1	0	1	1	1	0	1	Memory read
Parameter Byte 1 (PB1)	1	0	1	Data to be read													Read data

(14) Partial in (PTLIN) - Parameter Byte: 2 (A8H)

This command is to specify the partial display area. It will turn on partial display of the screen (dividing screen by lines) to save power. Since ST7529 processes the liquid crystal display signal on 4-line basis (block basis), the display and no-display areas are also specified on 4-bit line (block basis).

	A0	RD	RW	D7	D6	D5	D4	D3	D2	D1	D0	Function
Command	0	1	0	1	0	1	0	1	0	0	0	--
Parameter Byte 1 (PB1)	1	1	0	*	*	PTS5	PTS4	PTS3	PTS2	PTS1	PTS0	Start block address
Parameter Byte 2 (PB2)	1	1	0	*	*	PTE5	PTE4	PTE3	PTE2	PTE1	PTE0	End block address

Only the address of the display block can be specified for the partial display. Do not specify an address not to be displayed when scrolled.

(15) Partial out (PTLOUT) - Parameter Byte: none (A9H)

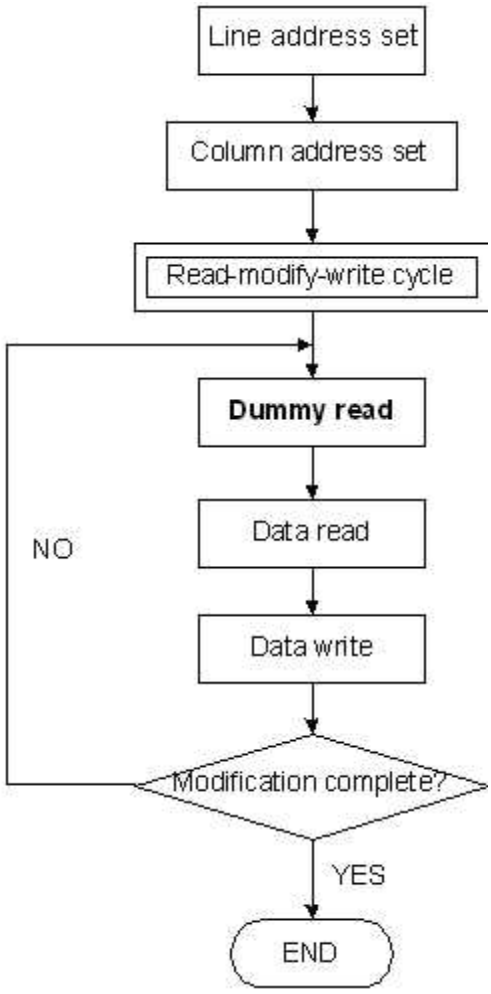
This command is to exit the PARTIAL DISPLAY MODE.

	A0	RD	RW	D7	D6	D5	D4	D3	D2	D1	D0
Command	0	1	0	1	0	1	0	1	0	0	1

(16) Read modify write in (RMWIN) - Parameter Byte: none (E0H)

This command is used along with the (9) line address set command (LASET), (10) column address set command (CASET), and (17) read modify write out command (RMWOUT). This function is for frequently modified data on a specific area, such as blinking cursor. First, set a specific display area using the column and line address commands. Then, execute this command to set the column and line addresses as the start address of the specific area. When this operation is complete, the column and line address will not be modified by the display data read command. It is increased only when the display data write command is executed. You can cancel this mode by entering the read modify write out or any other command.

	A0	RD	RW	D7	D6	D5	D4	D3	D2	D1	D0
Command	0	1	0	1	1	1	0	0	0	0	0



(17) Read modify write out (RMWOUT) - Parameter Byte: none (EEH)

This command cancels the read modify write mode.

	A0	RD	RW	D7	D6	D5	D4	D3	D2	D1	D0
Command	0	1	0	1	1	1	0	1	1	1	0

(18) Area scroll set (ASCSET) - Parameter Byte: 4 (AAH)

It is to scroll only the specified portion of the screen (dividing the screen by lines). This command specifies the scrolling type of area, fixed area and scrolled area.

	A0	RD	RW	D7	D6	D5	D4	D3	D2	D1	D0	Function
Command	0	1	0	1	0	1	0	1	0	1	0	--
Parameter Byte 1 (PB1)	1	1	0	*	*	TB5	TB4	TB3	TB2	TB1	TB0	Top block address
Parameter Byte 2 (PB2)	1	1	0	*	*	BB5	BB4	BB3	BB2	BB1	BB0	Bottom block address
Parameter Byte 3 (PB3)	1	1	0	*	*	NSB5	NSB4	NSB3	NSB2	NSB1	NSB0	Number of specified blocks
Parameter Byte 4 (PB4)	1	1	0	*	*	*	*	*	*	SCM1	SCM0	Area scroll mode

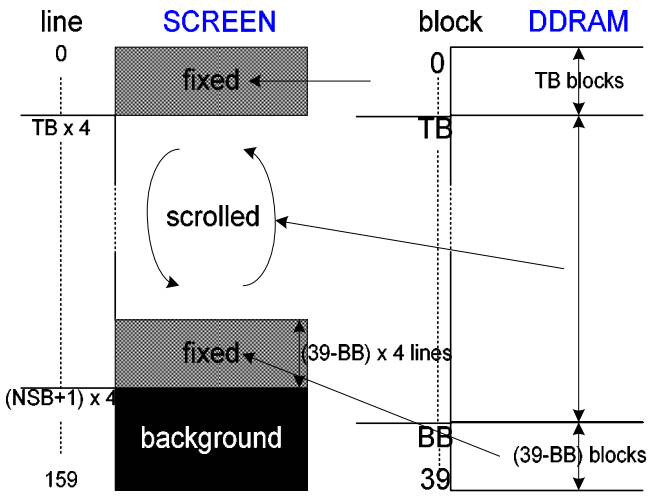
PB4: It is used to specify the scrolling mode.

SCM1	SCM0	Scrolling Mode	Settings		
			Top block address (TB)	Bottom block address (BB)	Number of specified blocks (NSB)
0	0	Center mode	Top(fixed area) height = Top address	Bottom(fixed area) height = 39-Bottom address	Bottom start address = Specified number
0	1	Top mode	0	Bottom(fixed area) height = 39-Bottom address	Bottom start address = Specified number
1	0	Bottom mode	Top(fixed area) height = Top address	39	39
1	1	Whole mode	0	39	39

Since ST7529 processes the liquid crystal display signals on the four-line basis (block basis), fixed and scrolled areas are also specified on the four-line basis (block basis).

DDRAM address of the top fixed area is set in the block address increasing direction starting with the 0th block.

DDRAM address of the bottom fixed area is set in the block address decreasing direction starting with 39st block. The DDRAM address of other blocks fixed areas are assigned to the scrolled + background areas.



PB1 is to specify the top block address of the scrolled + background areas. Specify the 0th block for the top screen scroll or whole screen scroll.

PB2 specifies the bottom address of the scroll + background areas. Specify the 39th block for the bottom or whole screen scroll. The relation that top block address < bottom block address must be maintained.

PB3 specifies a specific number of blocks {Numbers of (Top fixed area +Scroll area) block-1}. In the case of the bottom scroll or whole screen scroll, the value is identical with PB2.

The user can turn on the area scroll function by executing the area scroll set command first and then specifying the display start block of the scroll area with the scroll start set command.

(19) Scroll start address set (SCSTART) - Parameter Byte: 1 (ABH)

This command is to specify which line address of DDRAM to be the start line content shown on screen. Note that you must execute this command after executing the area scroll set command. Scroll becomes available by dynamically changing the start block address.

	A0	RD	RW	D7	D6	D5	D4	D3	D2	D1	D0	Function
Command	0	1	0	1	0	1	0	1	0	1	1	--
Parameter Byte 1 (PB1)	1	1	0	*	*	SB5	SB4	SB3	SB2	SB1	SB0	Start block address

Note : Don't repeat "Area scroll set(AAH)" instruction when "Scroll start address set" is executed.

(20) Internal oscillation on (OSCON) - Parameter Byte: none (D1H)

This command turns on the internal oscillation circuit. It is valid only when the internal oscillation circuit CLS = HIGH.

	A0	RD	RW	D7	D6	D5	D4	D3	D2	D1	D0
Command	0	1	0	1	1	0	1	0	0	0	1

(21) Internal oscillation off (OSCOFF) - Parameter Byte: none (D2H)

It turns off the internal oscillation circuit. The circuit is also turned off in the reset mode.

	A0	RD	RW	D7	D6	D5	D4	D3	D2	D1	D0
Command	0	1	0	1	1	0	1	0	0	1	0

(22) Power control set (PWRCTRL) - Parameter Byte: 1 (20H)

This command is used to turn on or off the Booster circuit, voltage regulator circuit, and reference voltage.

	A0	RD	RW	D7	D6	D5	D4	D3	D2	D1	D0	Function
Command	0	1	1	0	0	1	0	0	0	0	0	--
Parameter Byte 1 (PB1)	1	1	0	*	*	*	0	VB	0	VF	VR	LCD drive power

VR turns on/off the reference voltage generation circuit. VR = “1”: ON, VR =” 0”: OFF

VF turns on/off the circuit voltage follower. VF = “1”: ON, VF =” 0”: OFF

VB: It turns on or off the Booster. VB = “1”: ON, VB =” 0”: OFF

(23) Electronic volume control (VOLCTRL) - Parameter Byte: 2 (81H)

The command is used to program the optimum LCD supply voltage V_{LCD}. Refer to 7.10.2.

	A0	RD	RW	D7	D6	D5	D4	D3	D2	D1	D0	Function
Command	0	1	0	1	0	0	0	0	0	0	1	--
Parameter Byte 1 (PB1)	1	1	0	*	*	VPR5	VPR4	VPR3	VPR2	VPR1	VPR0	VPR[5:0]
Parameter Byte 2 (PB2)	1	1	0	*	*	*	*	*	VPR8	VPR7	VPR6	VPR[8:6]

With the VOLUP and VOLDOWN command the V_{LCD} voltage and therewith the contrast of the LCD can be adjusted.

(24) Increment electronic control (VOLUP) - Parameter Byte: none (D6H)

This command increments electronic control value VCON of voltage regulator circuit by 1.

	A0	RD	RW	D7	D6	D5	D4	D3	D2	D1	D0
Command	0	1	0	1	1	0	1	0	1	1	0

If you set the electronic control value to 111111, the control value is set to 000000 after this command has been executed.

(25) Decrement electronic control (VOLDOWN) - Parameter Byte: none (D7H)

This command decrements electronic control value VCON of voltage regulator circuit by 1.

	A0	RD	RW	D7	D6	D5	D4	D3	D2	D1	D0
Command	0	1	0	1	1	0	1	0	1	1	1

If you set the electronic control value to 000000, the control value is set to 111111 after this command has been executed.

(26) Reserved (82H)

Do not use this command.

	A0	RD	RW	D7	D6	D5	D4	D3	D2	D1	D0
Command	0	1	0	1	0	0	0	0	0	1	0

(27) Read Register 1 (EPSRRD1) Command: 1 Parameter Byte: none (7CH)

Execute the EPSRRD1 and STREAD (Status Read) commands in succession to read the Electronic Control value.

	A0	RD	RW	D7	D6	D5	D4	D3	D2	D1	D0
Command	0	1	0	0	1	1	1	1	1	0	0

Execute the Status Read command immediately after this command and execute the NOP command after the STREAD (Status Read) command.

(28) Read Register 2 (EPSRRD2) Command: 1 Parameter Byte: none (7DH)

Execute the EPSRRD2 and STREAD (Status Read) commands in succession to read the built-in resistance ratio.

	A0	RD	RW	D7	D6	D5	D4	D3	D2	D1	D0
Command	0	1	0	0	1	1	1	1	1	0	1

Execute the Status Read command immediately after this command and execute the NOP(Reset) command after the STREAD (Status Read) command.

(29) Non-operating (NOP) - Parameter Byte: none (25H)

This command does not affect the operation but has the function of canceling the IC test mode. Thus, it is recommended to enter it periodically to prevent malfunctioning due to noise and so on.

	A0	RD	RW	D7	D6	D5	D4	D3	D2	D1	D0
Command	0	1	0	0	0	1	0	0	1	0	1

(30) Status read (STREAD) - Parameter Byte: none

The command is to read the internal condition of the IC. One status can be displayed depending on the setting status after reset or after NOP operation.

	A0	RD	RW	D7	D6	D5	D4	D3	D2	D1	D0
Command	0	0	1	Status data							

D7: Area scroll mode	Refer to SCM1 (ASCSET)

EXT="1"

The ST7529 applies 16-gray level and 2 FRC to achieve 32-gray scale display. Every gray level is in the strength controlled by 31-PWM (5-bit). The following 2 commands are to set the gray scale value.

(1) Set Gray 1 value (Gray 1 set) - Parameter Byte: 16 (20H)

Command	A0	RD	WR	D7	D6	D5	D4	D3	D2	D1	D0	Function
Gray1 Set	0	1	0	0	0	1	0	0	0	0	0	ODD FRAME Gray PWM Set
Parameter Byte 1 (PB1)	1	1	0	*	*	*	G0F14	G0F13	G0F12	G0F11	G0F10	Set Gray level 0 at odd frames
Parameter Byte 2 (PB2)	1	1	0	*	*	*	G1F14	G1F13	G1F12	G1F11	G1F10	Set Gray level 1 at odd frames
Parameter Byte 14 (PB14)	1	1	0	*	*	*	G13F14	G13F13	G13F12	G13F11	G13F10	Set Gray level 13 at odd frames
Parameter Byte 16 (PB16)	1	1	0	*	*	*	G15F14	G15F13	G15F12	G15F11	G15F10	Set Gray level 15 at odd frames

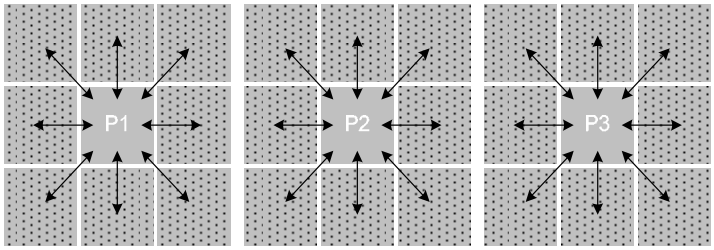
(2) Set Gray 2 value (Gray 2 set) - Parameter Byte: 16 (21H)

Command	A0	RD	WR	D7	D6	D5	D4	D3	D2	D1	D0	Function
Gray1 Set	0	1	0	0	0	1	0	0	0	0	1	EVEN FRAME Gray PWM Set
Parameter Byte 1 (PB1)	1	1	0	*	*	*	G0F24	G0F23	G0F22	G0F21	G0F20	Set Gray level 0 at even frames
Parameter Byte 2 (PB2)	1	1	0	*	*	*	G1F24	G1F23	G1F22	G1F21	G1F20	Set Gray level 1 at even frames
Parameter Byte 14 (PB14)	1	1	0	*	*	*	G13F24	G13F23	G13F22	G13F21	G13F20	Set Gray level 13 at even frames
Parameter Byte 16 (PB16)	1	1	0	*	*	*	G15F24	G15F23	G15F22	G15F21	G15F20	Set Gray level 15 at even frames

(3) Weight Set (Wt. set) - Parameter Byte: 3 (22H)

	A0	RD	RW	D7	D6	D5	D4	D3	D2	D1	D0	Function
Command	0	1	0	0	0	1	0	0	0	1	0	---
Parameter Byte 1 (PB1)	1	1	0	*	*	*	*	*	WT2	WT1	WT0	
Parameter Byte 2 (PB2)	1	1	0	*	*	*	ED4	ED3	ED2	ED1	ED0	set edge detector detect value
Parameter Byte 3 (PB3)	1	1	0	*	*	*	*	*	*	EE	WE	

PB1: Weighting Set



Compared with stripe, SPRD uses fewer channels but lost only a little part of display information. The additional " Weighting set " is to recompense color information.

In normal display, there is relativity of color between pixel and pixel. Therefore, the lost element can be used to compensate the next pixel and enhance the display quality.

The sum of all " Weight set " values should be equal to " 1 " :

P1(x-1,y-1) + P1 (x,y-1) + P1(x+1,y-1) + P1(x-1,y) + P1(x,y) + P1(x+1,y) + P1(x-1,y+1) + P1(x,y+1) + P1(x+1,y+1) = 1

P2(x-1,y-1) + P2(x,y-1) + P2(x+1,y-1) + P2(x-1,y) + P2(x,y) + P2(x+1,y) + P2(x-1,y+1) + P2(x,y+1) + P2(x+1,y+1) = 1

P3(x-1,y-1) + P3(x,y-1) + P3(x+1,y-1) + P3(x-1,y) + P3(x,y) + P3(x+1,y) + P3(x-1,y+1) + P3(x,y+1) + P3(x+1,y+1) = 1

WT2	WT1	WT0	Weighting k
0	0	0	0/8
0	0	1	1/8
0	1	0	2/8
0	1	1	3/8 (default)
1	0	0	4/8

Assume the dots on display are arranged as follows.

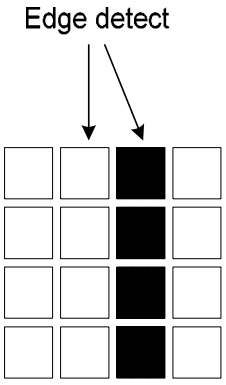
D_0	D_1	…	D_i	…	D_{n-1}	D_n

After processed, D_i will become $kD_{i-1}+(1-k)D_i$. In addition, the new value will be saved as D_i'– the new D_i in RAM.

PB2: set edge detector detect value

ED4	ED3	ED2	ED1	ED0	detect value
0	0	0	0	0	0
0	0	0	0	1	1
0	0	0	1	0	2
0	0	0	1	1	3
0	1	1	1	0	14
0	1	1	1	1	15
1	0	0	0	0	16 (default)
1	0	0	0	1	17
1	0	0	1	0	18
1	1	1	0	0	28
1	1	1	0	1	29
1	1	1	1	0	30
1	1	1	1	1	31

When "Edge detect" is enabled, the difference value between pixel and pixel which is large enough will activate the "Weight set" function.



PB3:

EE	WE	
0	0	no weighting
0	1	weighting enable
1	*	weighting + edge detect

***: don't care**

(4) Analog circuit set (ANASET) – Parameter Byte: 3 (32H)

	A0	RD	WR	D7	D6	D5	D4	D3	D2	D1	D0	Function
Command	0	1	0	0	0	1	1	0	0	1	0	—
Parameter Byte 1 (PB1)	1	1	0	*	*	*	*	*	OSF2	OSF1	OSF0	OSC frequency Adjustment
Parameter Byte 2 (PB2)	1	1	0	*	*	*	*	*	*	BE1	BE0	Booster Efficiency Set
Parameter Byte 3 (PB3)	1	1	0	*	*	*	*	*	BS2	BS1	BS0	Bias setting

PB1: Oscillator frequency adjustment

OSF0	OSF1	OSF2	Frequency (KHz)
0	0	0	12.7 (Default)
0	0	1	13.2
0	1	0	14.3
0	1	1	15.7
1	0	0	17.3
1	0	1	19.3
1	1	0	21.9
1	1	1	25.4

Condition : 1/160 duty, $f_{CL(Hz)}$ = Frame frequency x (duty + 1dummy)

PB2: Booster Efficiency set

BE1	BE0	Frequency on booster capacitors (Hz)
0	0	3K
0	1	6K (Default)
1	0	12K
1	1	24K

PB3: Select LCD bias ratio of the voltage required for driving the LCD.

BS2	BS1	BS0	LCD bias
0	0	0	1/14
0	0	1	1/13
0	1	0	1/12
0	1	1	1/11
1	0	0	1/10
1	0	1	1/9
1	1	0	1/7
1	1	1	1/5

(5) Color Dither OFF (DITHOFF) - Parameter Byte: None (34H)

Turn off the dithering circuit.

	A0	RD	RW	D7	D6	D5	D4	D3	D2	D1	D0
Command	0	1	0	0	0	1	1	0	1	0	0

(6) Color Dither ON (DITHON) - Parameter Byte: None (35H)

Turn on the dithering circuit.

	A0	RD	RW	D7	D6	D5	D4	D3	D2	D1	D0
Command	0	1	0	0	0	1	1	0	1	0	1

(7) Control EEPROM (EPCTIN) - Parameter Byte: 1 (CDH)

	A0	RD	RW	D7	D6	D5	D4	D3	D2	D1	D0
Command	0	1	0	1	1	0	0	1	1	0	1
Parameter Byte 1 (PB1)	1	1	0	0	0	EEWR	0	0	0	0	0

When EEWR = “1”, EEPROM will be Write Enable; when EEWR = “0”, EEPROM will be Read Enable.

(8) Cancel EEPROM Command (EPCOUT) - Parameter Byte: None (CCH)

This command is to cancel the EEPROM Read/Write Enable.

	A0	RD	RW	D7	D6	D5	D4	D3	D2	D1	D0
Command	0	1	0	1	1	0	0	1	1	0	0

(9) Write data to EEPROM (EPMWR) - Parameter Byte: None (FCH)

This command is to Write data to EEPROM.

	A0	RD	RW	D7	D6	D5	D4	D3	D2	D1	D0
Command	0	1	0	1	1	1	1	1	1	0	0

(10) Read data from EEPROM (EPMRD) - Parameter Byte: None (FDH)

This command is to Read data from EEPROM.

	A0	RD	RW	D7	D6	D5	D4	D3	D2	D1	D0
Command	0	1	0	1	1	1	1	1	1	0	1

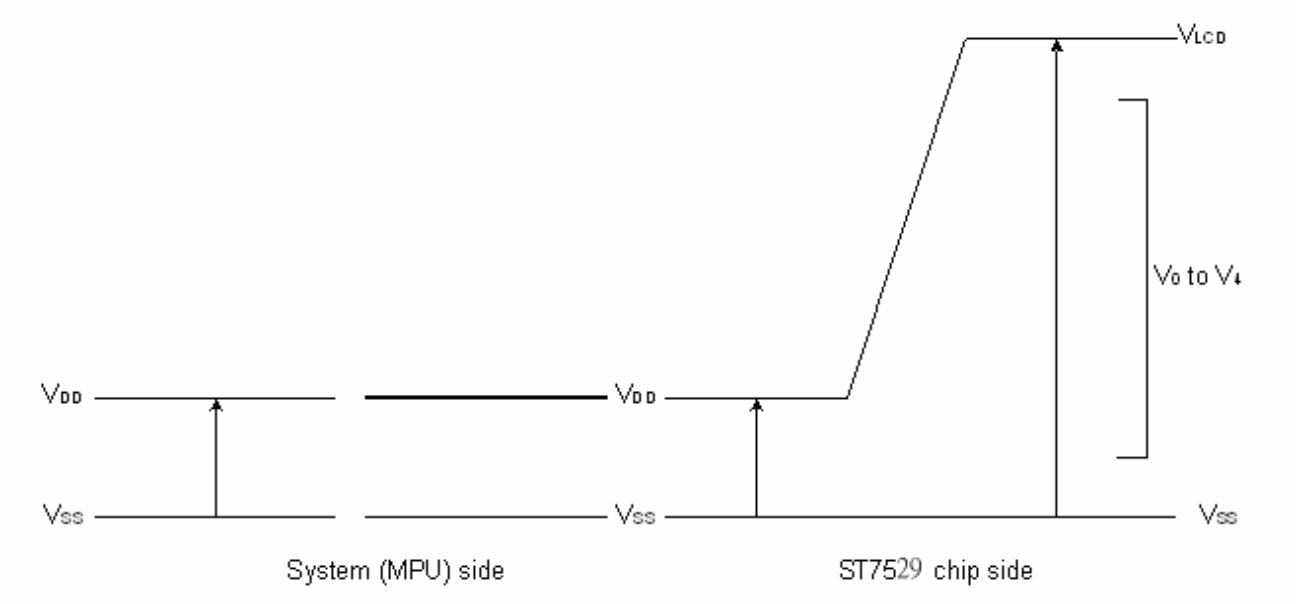
9. LIMITING VALUES

In accordance with the Absolute Maximum Rating System; see notes 1 and 2.

Parameter	Symbol	Conditions	Unit
Power Supply Voltage	VDD, VDD1	–0.5 ~ +5.0	V
Power supply voltage	VDD2, VDD3, VDD4, VDD5	-0.5 ~ +5.0	V
Power supply voltage (VDD standard)	VLCDIN, VLCDOUT	–0.5 ~ +22	V
Power supply voltage (VDD standard)	V0,V1, V2, V3, V4	0.3 to VLCDIN	V
Input voltage	VIN	–0.5 to VDD+0.5	V
Output voltage	VO	–0.5 to VDD+0.5	V
Operating temperature	TOPR	–40 to +85	°C
Storage temperature	TSTR	–65 to +150	°C



Notes

1. Stresses above those listed under Limiting Values may cause permanent damage to the device.
2. Parameters are valid over operating temperature range unless otherwise specified. All voltages are with respect to V_{SS} unless otherwise noted.
3. Insure that the voltage levels of V1, V2, V3, and V4 are always such that

   VLCDIN ≧ V0 ≧ V1 ≧ V2 ≧ V3 ≧ V4 ≧ Vss

10. HANDLING

Inputs and outputs are protected against electrostatic discharge in normal handling. However, to be totally safe, it is desirable to take normal precautions appropriate to handling MOS devices (see “Handling MOS devices”).

11. DC CHARACTERISTICS

T_a = -40℃ to +85℃

Item		Symbol	Condition	Rating			Units	Applicable Pin
				Min.	Typ.	Max.		
Operating Voltage (1)		VDD VDD1	-	2.4	-	3.3	V	VDD*1 VDD1
Operating Voltage (2)		VDD2 VDD3 VDD4 VDD5	(Relative to VSS)	2.4	-	3.3	V	VDD2 VDD3 VDD4 VDD5
High-level Input Voltage		VIH	-	0.7 VDD	-	VDD	V	*2
Low-level Input Voltage		VIL	-	VSS	-	0.3 VDD	V	*2
High-level Output Current		IOH	VDD=2.7V VOH =2.2V	0.5	-	-	mA	*3
Low-level Output Current		IOL	VDD=2.7V VOL = 0.5V	-	-	-0.5	mA	*3
Input leakage current		ILI	VIN = VDD or VSS	-1.0	-	1.0	μA	*4
Liquid Crystal Driver ON Resistance		RON	Ta = 25°C (Relative To VSS) V0 = 14.0V VDD = 2.7V	-	1.4	2.0	KΩ	SEGn COMn *5
Oscillator Frequency	Internal Oscillator	fOSC	1/160 duty Ta = 25°C VDD = 2.7V CLD = 0	-	12.4	26	kHz	CL*6
	External Input	fCL		-	12.4	26	kHz	CL
	Frame frequency	fFRAME		-	78	160	Hz	SEGn

Item		Symbol	Condition	Rating			Units	Applicable Pin
				Min.	Typ.	Max.		
Internal Power	Input voltage	VDD	(Relative To VSS)	2.4	-	3.3	V	VDD
	Supply Step-up output voltage Circuit	VLCDOUT	(Relative To VSS)	-	-	18	V	VLCDOUT
	Voltage regulator Circuit Operating Voltage	VLCDIN	(Relative To VSS)	-	-	18	V	VLCDIN

Dynamic Consumption Current : During Display, with the Internal Power Supply OFF Current consumed by total ICs when an external power supply is used .

Test pattern	Symbol	Condition	Rating			Units	Notes
			Min.	Typ.	Max.		
Display Pattern (checkerboard)	ISS	VDD = 2.7 V, V0 – VSS = 16.0 V Booster = 6x Bias = 1/12 Duty = 1/160 Bare chip Cap = 1.0uF	-	460	600	μA	*7
Power Down	ISS	Ta = 25°C	-	0.01	2	μA	-

Notes to the DC characteristics

1. The maximum possible V_{LCD} voltage that may be generated is dependent on voltage, temperature and (display) load, and internal clock
2. Power-down mode. During power down all static currents are switched off.
3. If external V_{LCD}, the display load current is not transmitted to I_{DD}.
4. V_{LCD} external voltage applied to VLCDIN pin; VLCDIN disconnected from VLCDOUT

References for items marked with *

*1. While a broad range of operating voltages is guaranteed, performance cannot be guaranteed if there are sudden fluctuations to the voltage while the MPU is being accessed.

SERIAL INTERFACE (3-Line Interface)

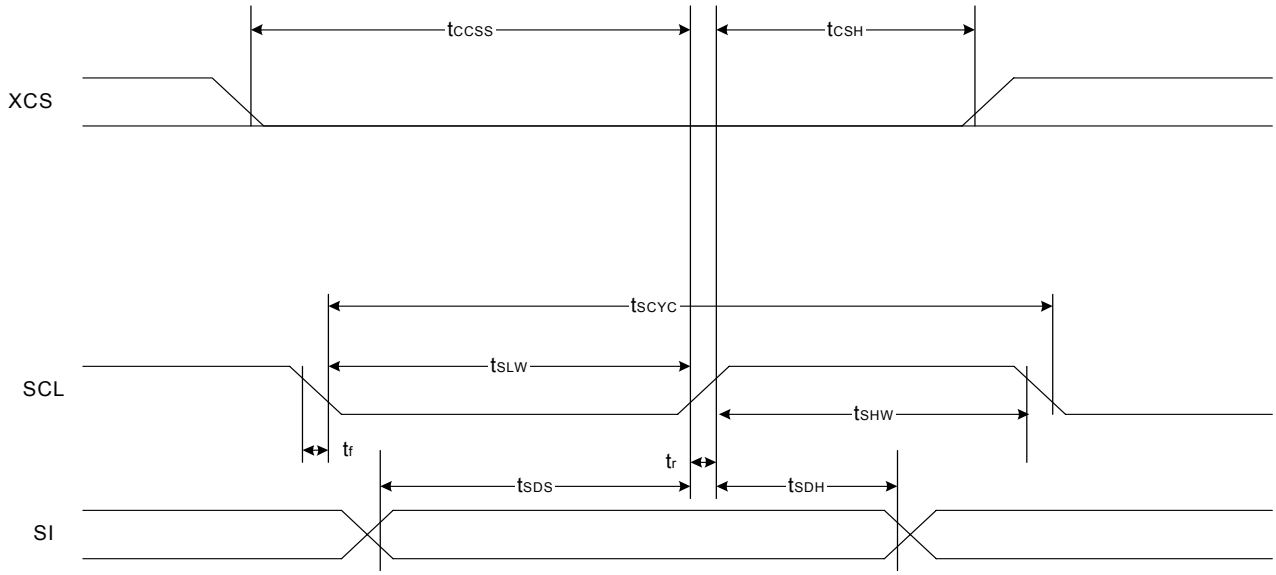

Fig 42.

(V_{DD}=3.3V,Ta= –40 to 85°C)

Item	Signal	Symbol	Condition	Rating		Units
				Min.	Max.	
Serial Clock Period	SCL	tSCYC	-	100	-	ns
SCL “H” pulse width		tSHW	-	50	-	
SCL “L” pulse width		tSLW	-	50	-	
Data setup time	SI	tSDS	-	30	-	
Data hold time		tSDH	-	30	-	
CS-SCL time	XCS	tCSS	-	20	-	
CS-SCL time		tCSH	-	50	-	

(V_{DD}=2.7V,Ta= –40 to 85°C)

Item	Signal	Symbol	Condition	Rating		Units
				Min.	Max.	
Serial Clock Period	SCL	tSCYC	-	110	-	ns
SCL “H” pulse width		tSHW	-	60	-	
SCL “L” pulse width		tSLW	-	50	-	
Data setup time	SI	tSDS	-	40	-	
Data hold time		tSDH	-	40	-	
CS-SCL time	XCS	tCSS	-	30	-	
CS-SCL time		tCSH	-	60	-	

*1 The input signal rise and fall time (tr, tf) are specified at 15 ns or less.

*2 All timing is specified using 20% and 80% of VDD as the standard.

13. RESET TIMING

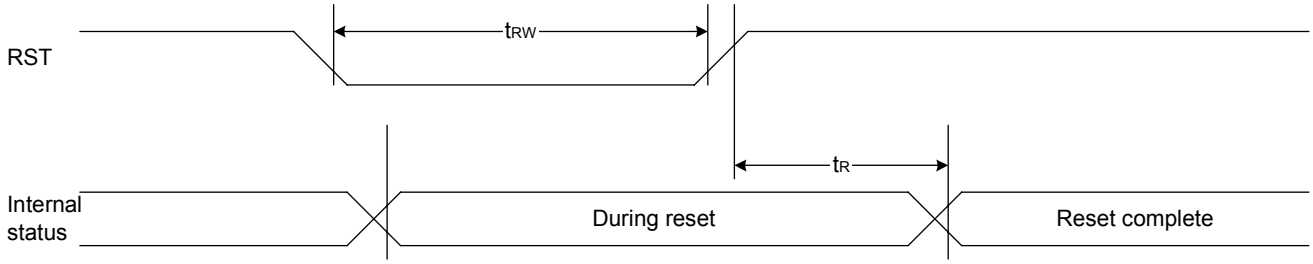

Fig 43.

(VDD =3.3V , Ta = –40 to 85°C)

Item	Signal	Symbol	Condition	Rating			Units
				Min.	Typ.	Max.	
Reset time		tR	-	-	-	1	us
Reset “L” pulse width	RST	tRW	-	1	-	-	us

(VDD = 2.7V , Ta = –40 to 85°C)

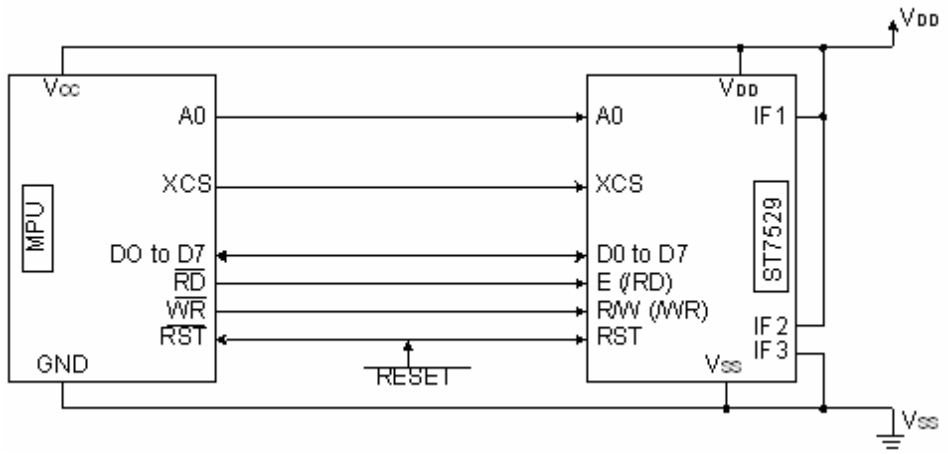
Item	Signal	Symbol	Condition	Rating			Units
				Min.	Typ.	Max.	
Reset time		tR	-	-	-	1.5	us
Reset “L” pulse width	RST	tRW	-	1.5	-	-	us

14. THE MPU INTERFACE (REFERENCE EXAMPLES)

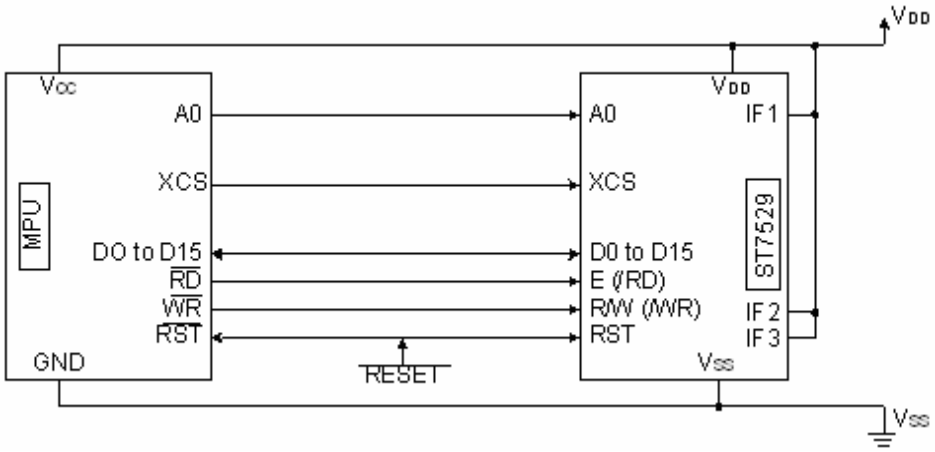
The ST7529 Series can be connected to either 8080 Series MPUs or to 6800 Series MPUs. Moreover, using the serial interface it is possible to operate the ST7529 series chips with fewer signal lines.

The display area can be enlarged by using multiple ST7529 Series chips. When this is done, the chip select signal can be used to select the individual Ics to access.

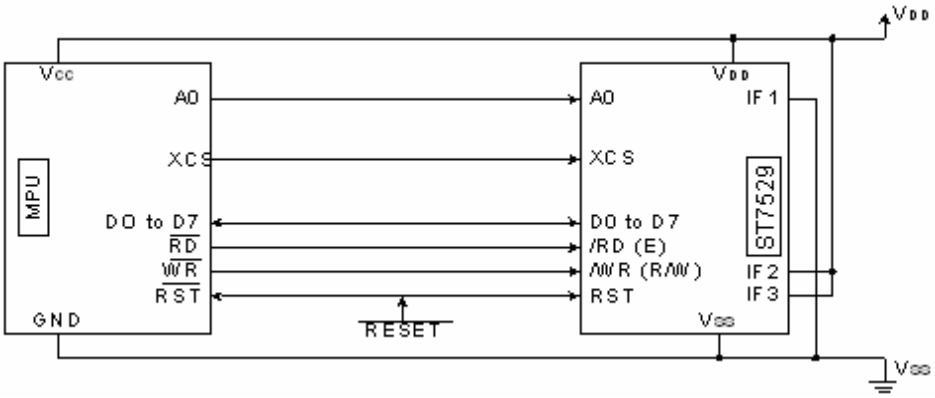
(1) 8080 Series MPUs(8 bit)



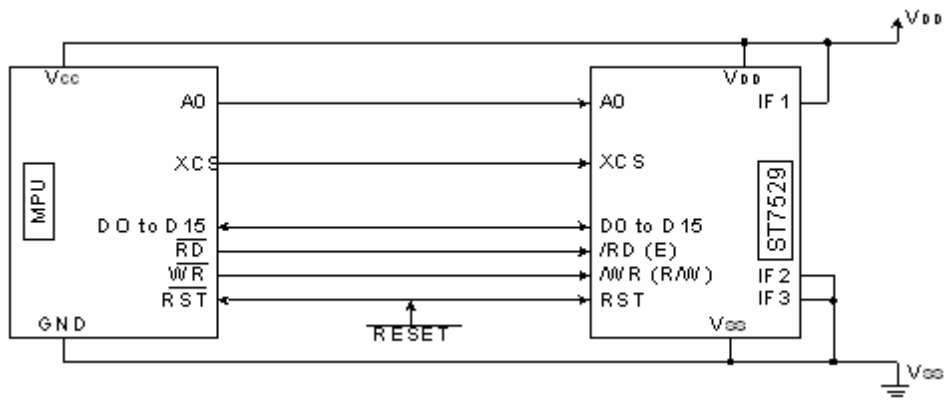
(2) 8080 Series MPUs(16 bit)



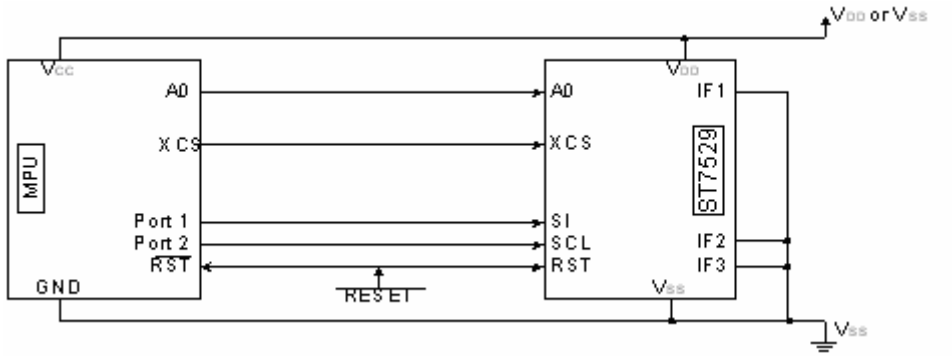
(3) 6800 Series MPUs(8 bit)



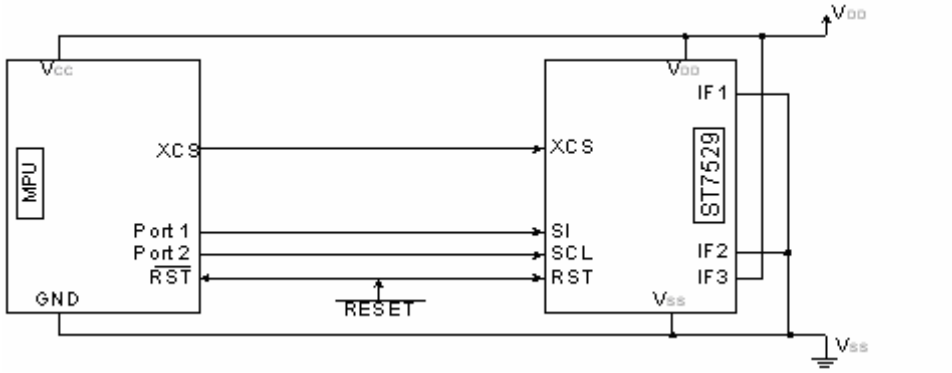
(4) 6800 Series MPUs(16 bit)



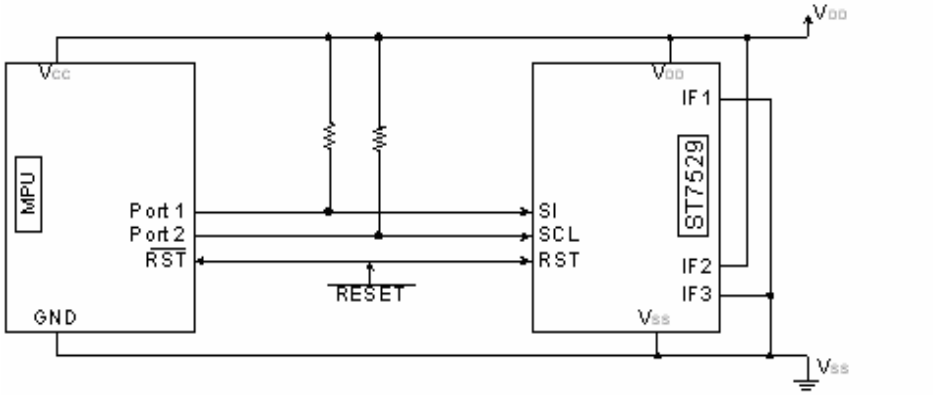
(5) Using the Serial Interface (4-line interface)



(3) Using the Serial Interface (3-line interface)

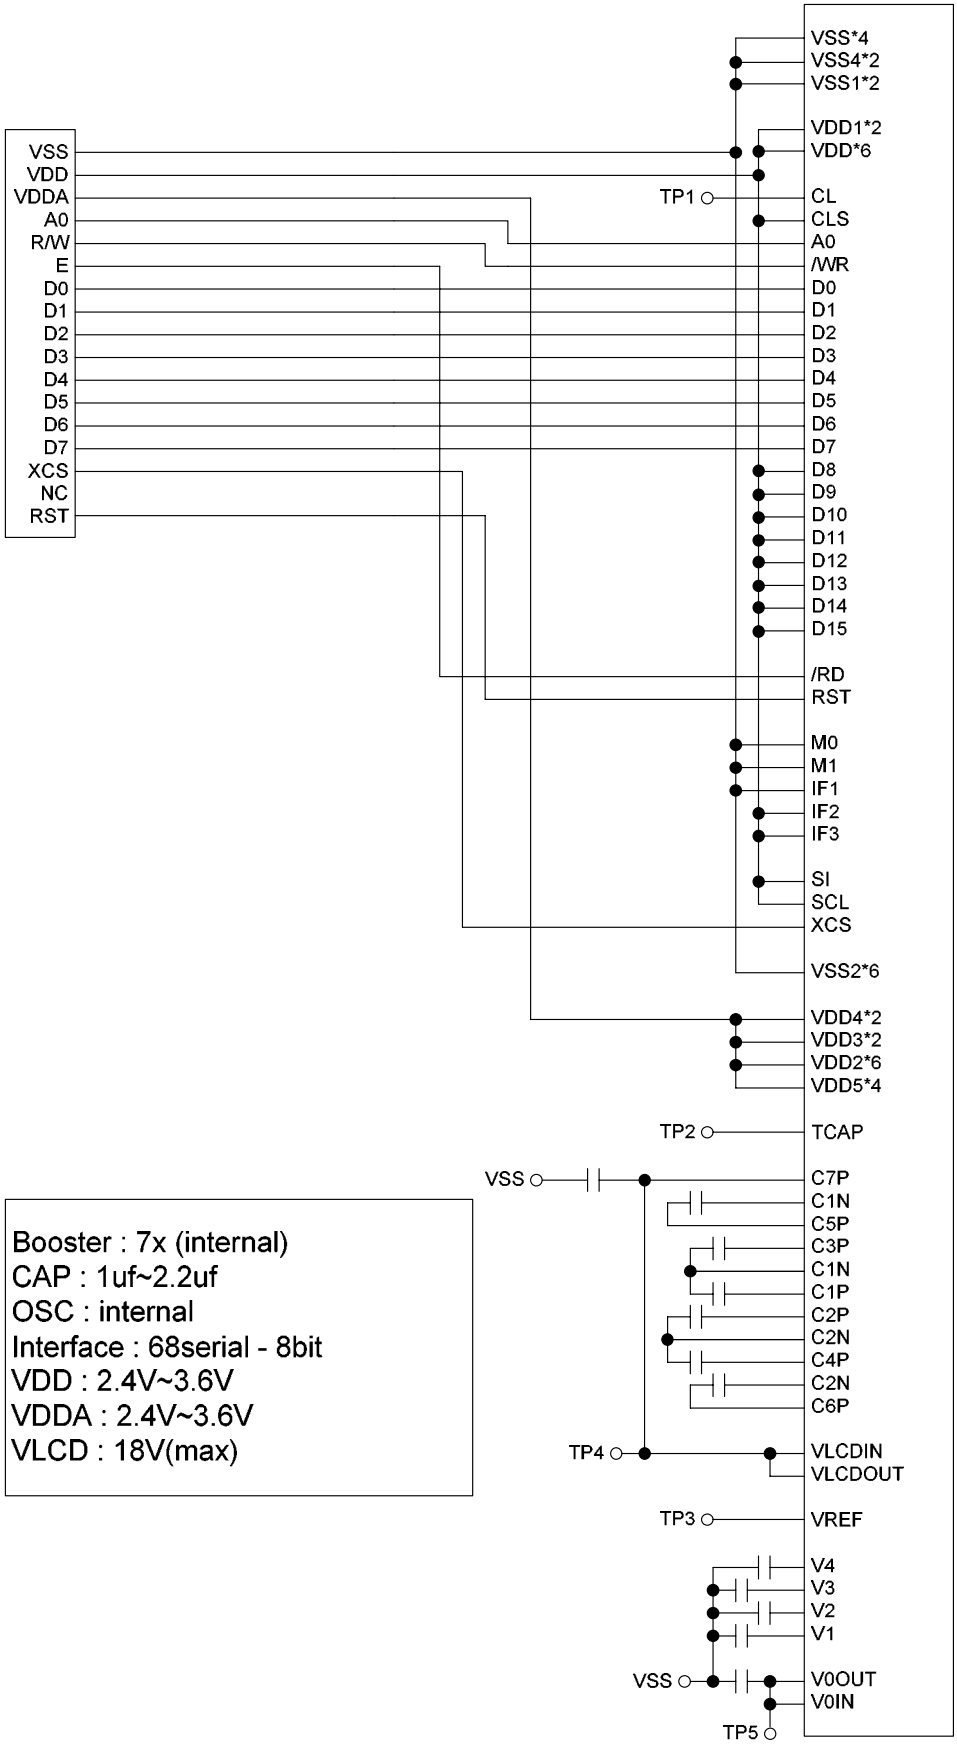


(4) Using the Serial Interface (2-line interface)

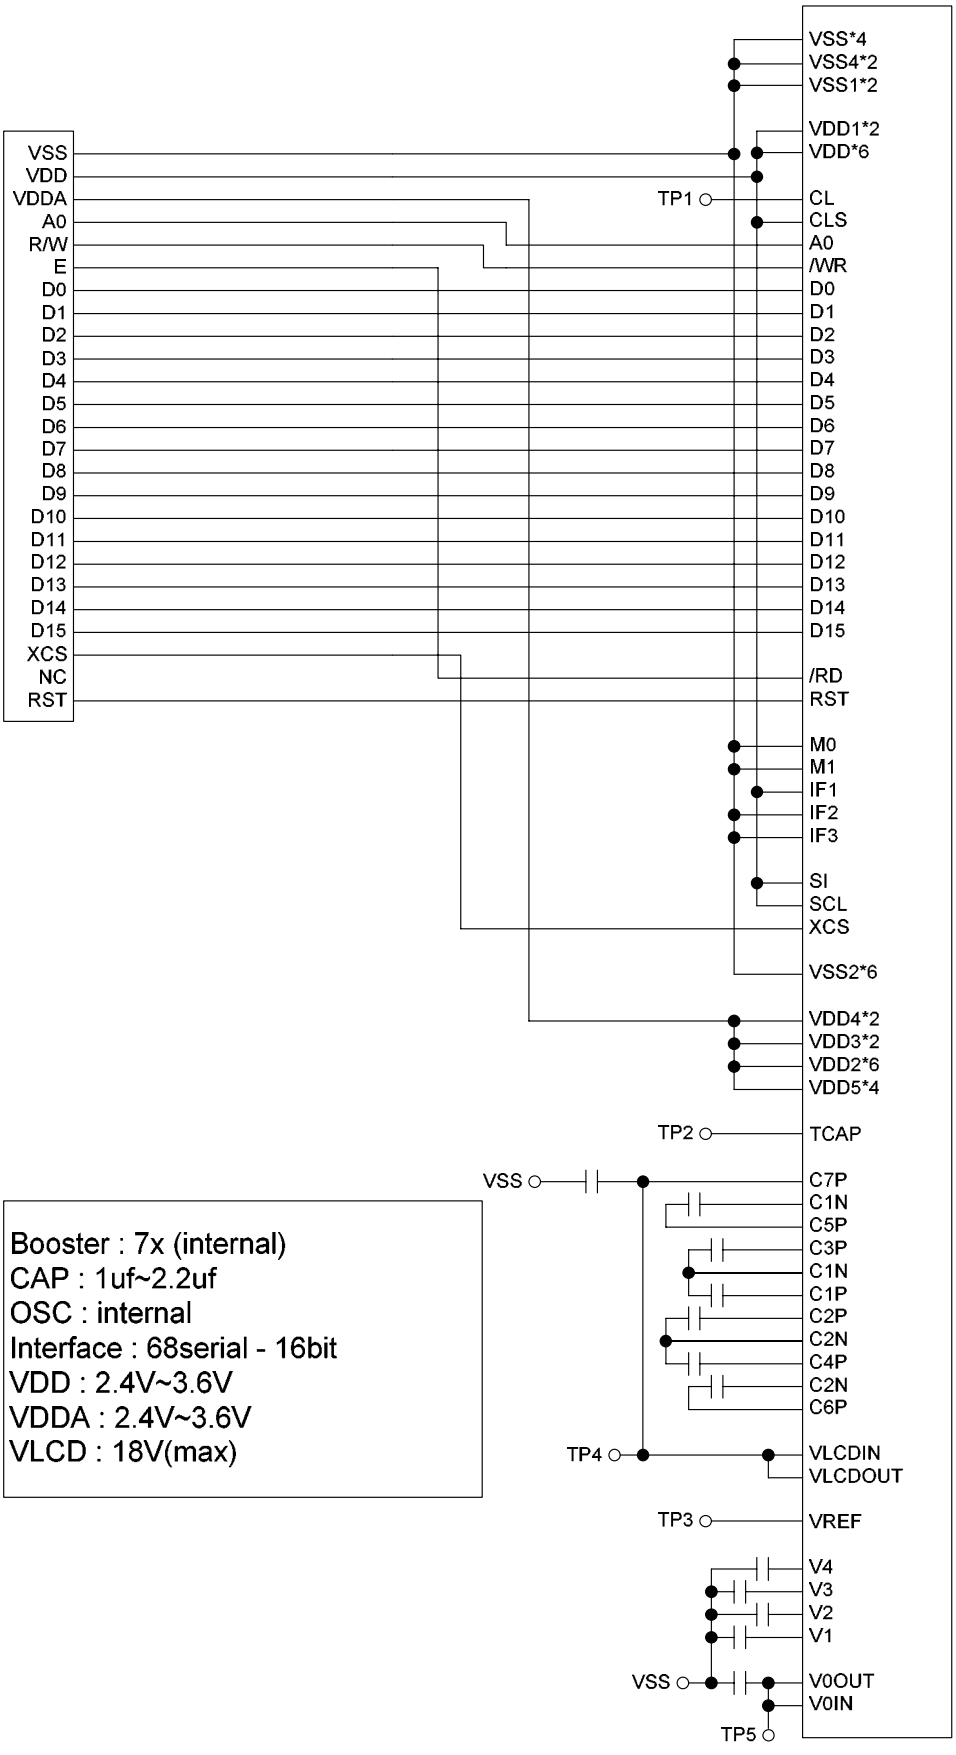


15. Application circuit

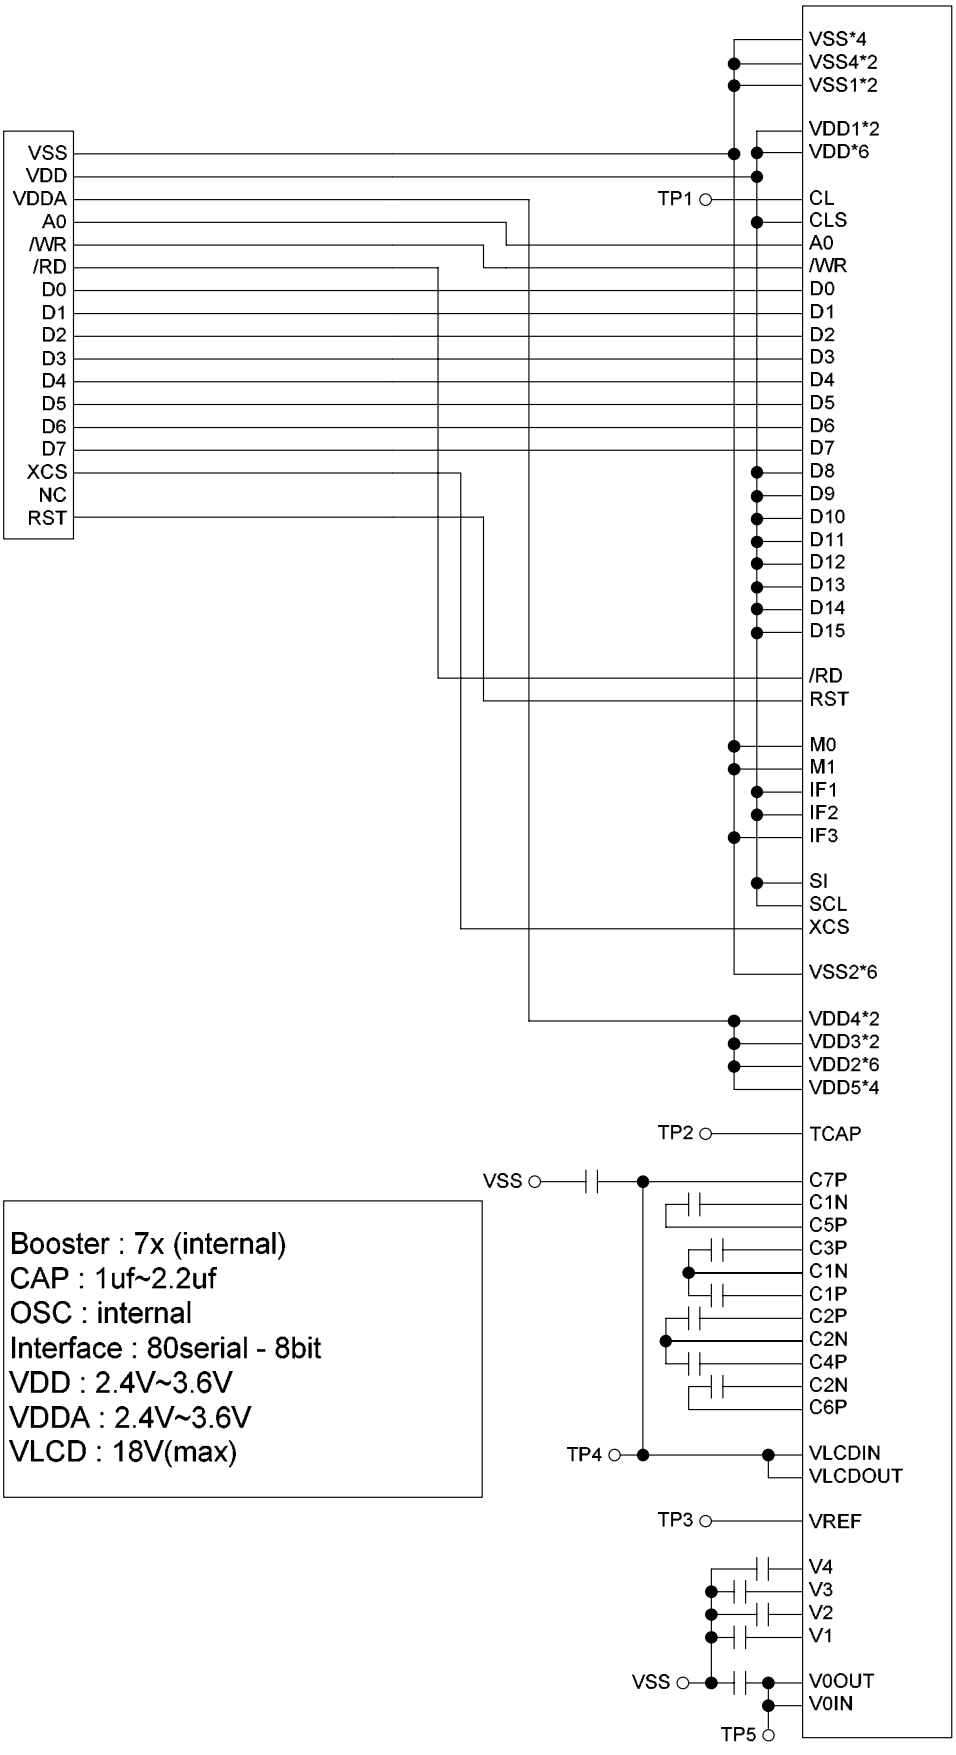
ST7529 / 68serial - 8bit



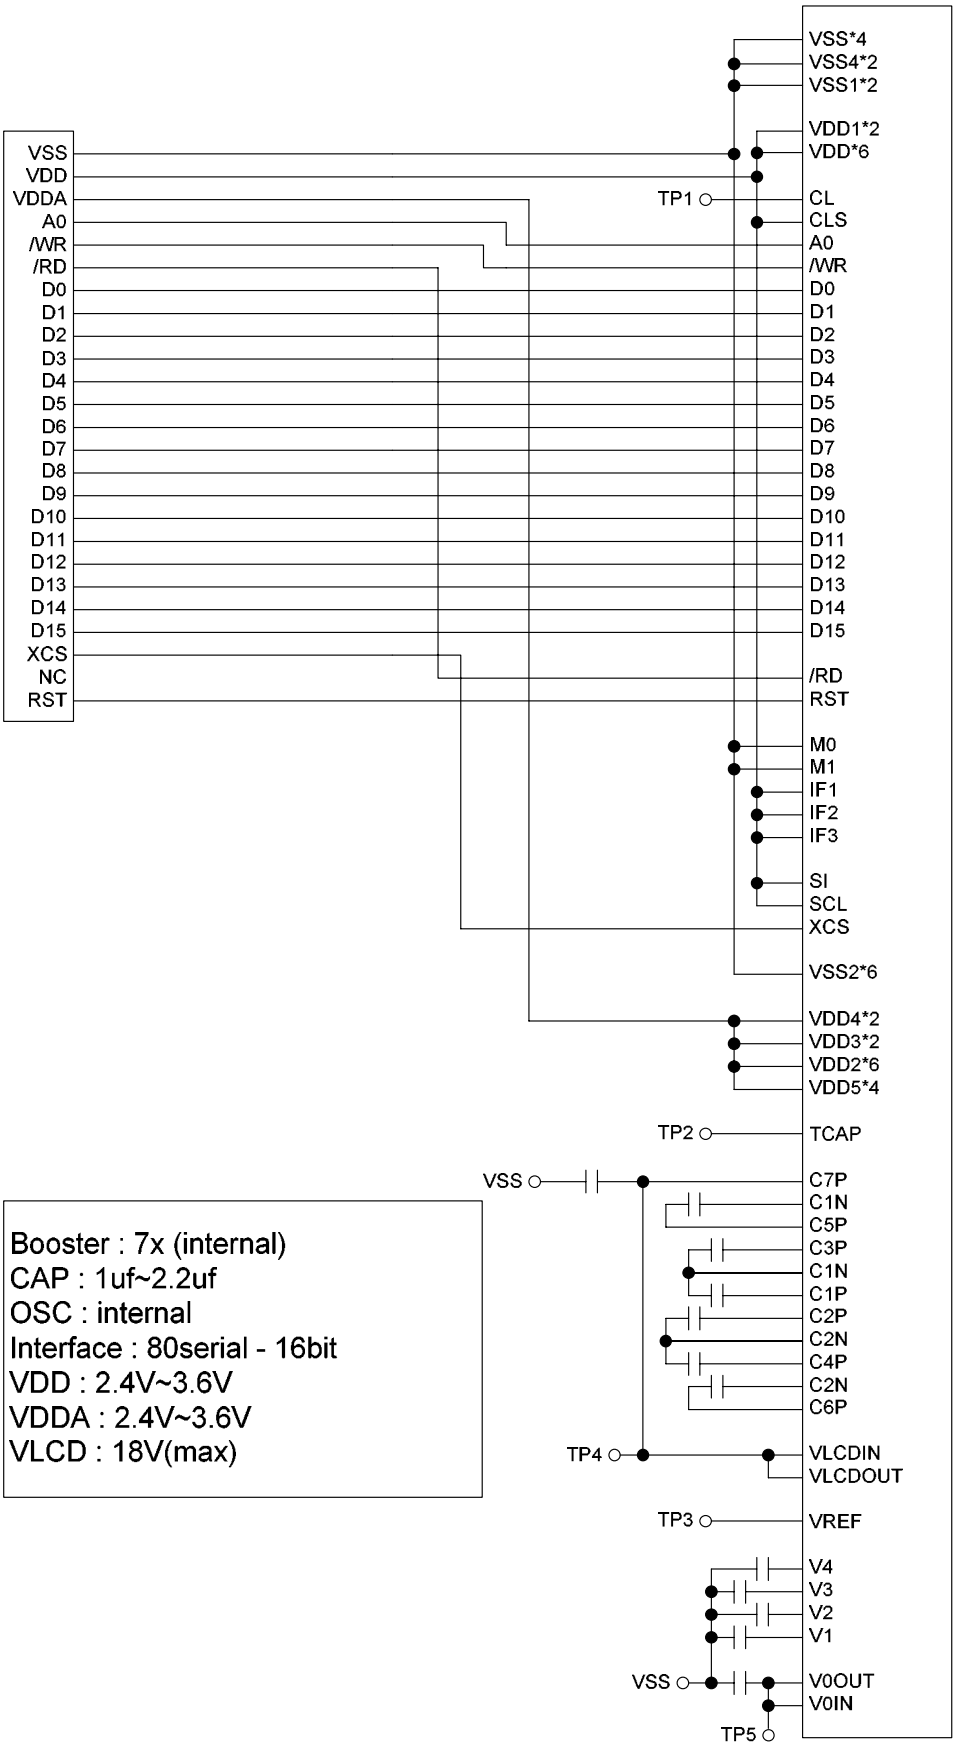
ST7529 / 68serial - 16bit



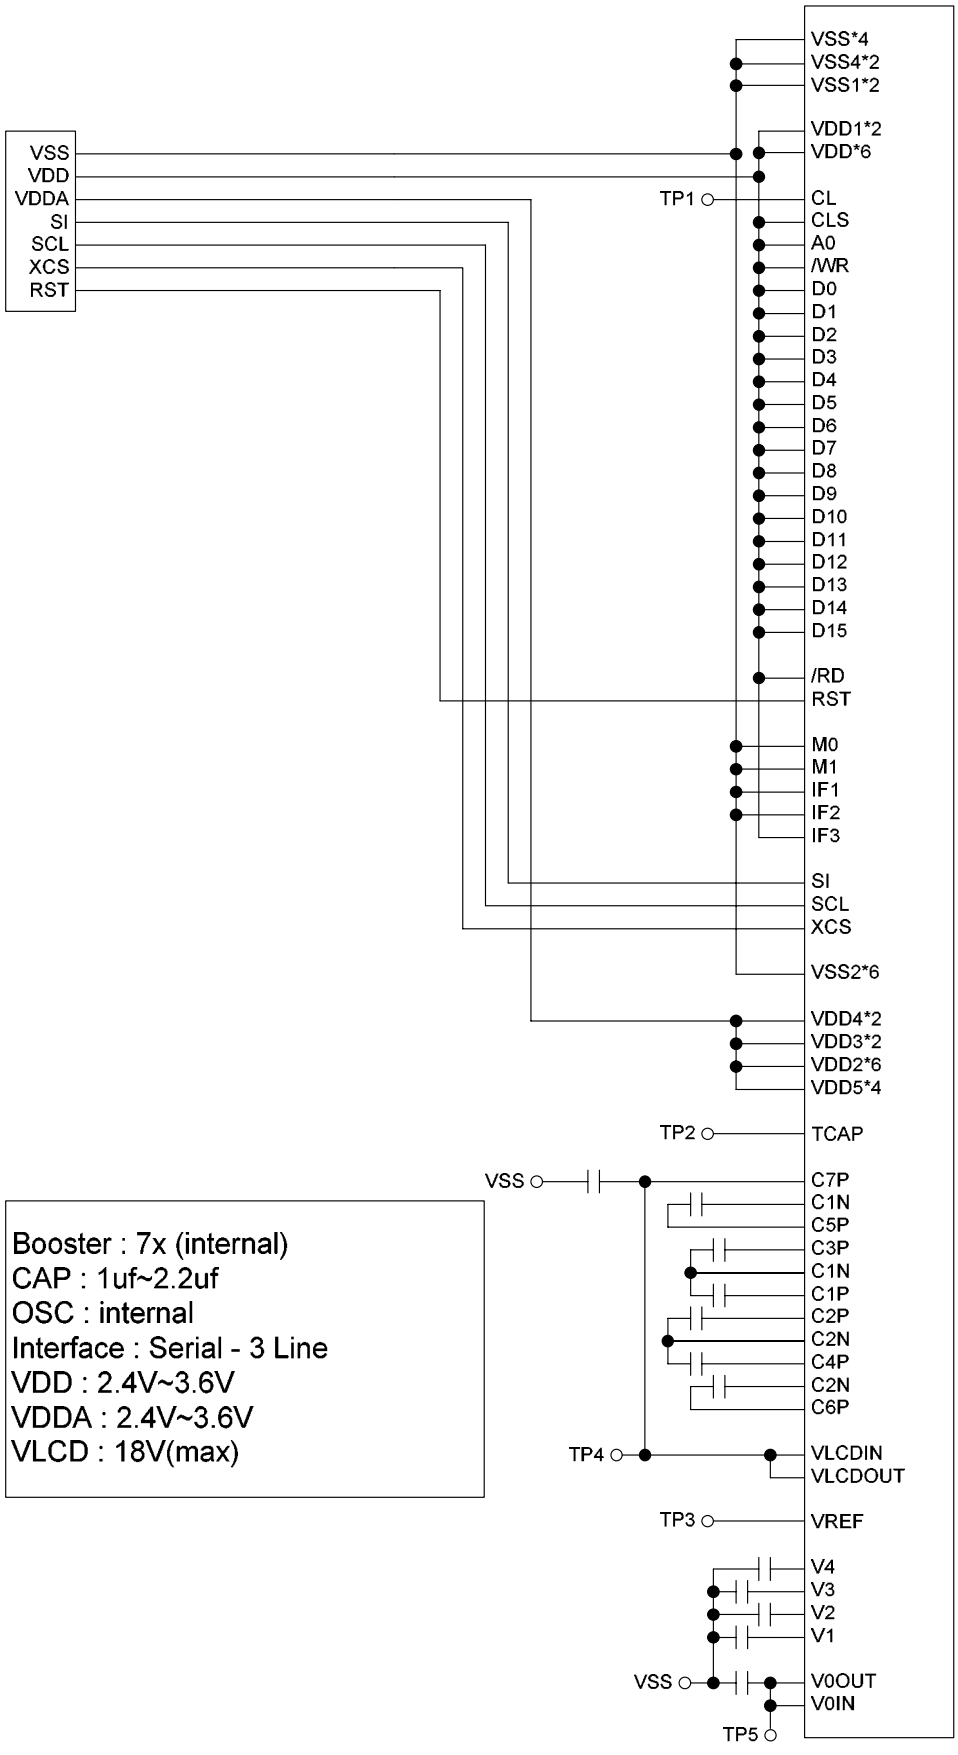
ST7529 / 80serial - 8bit



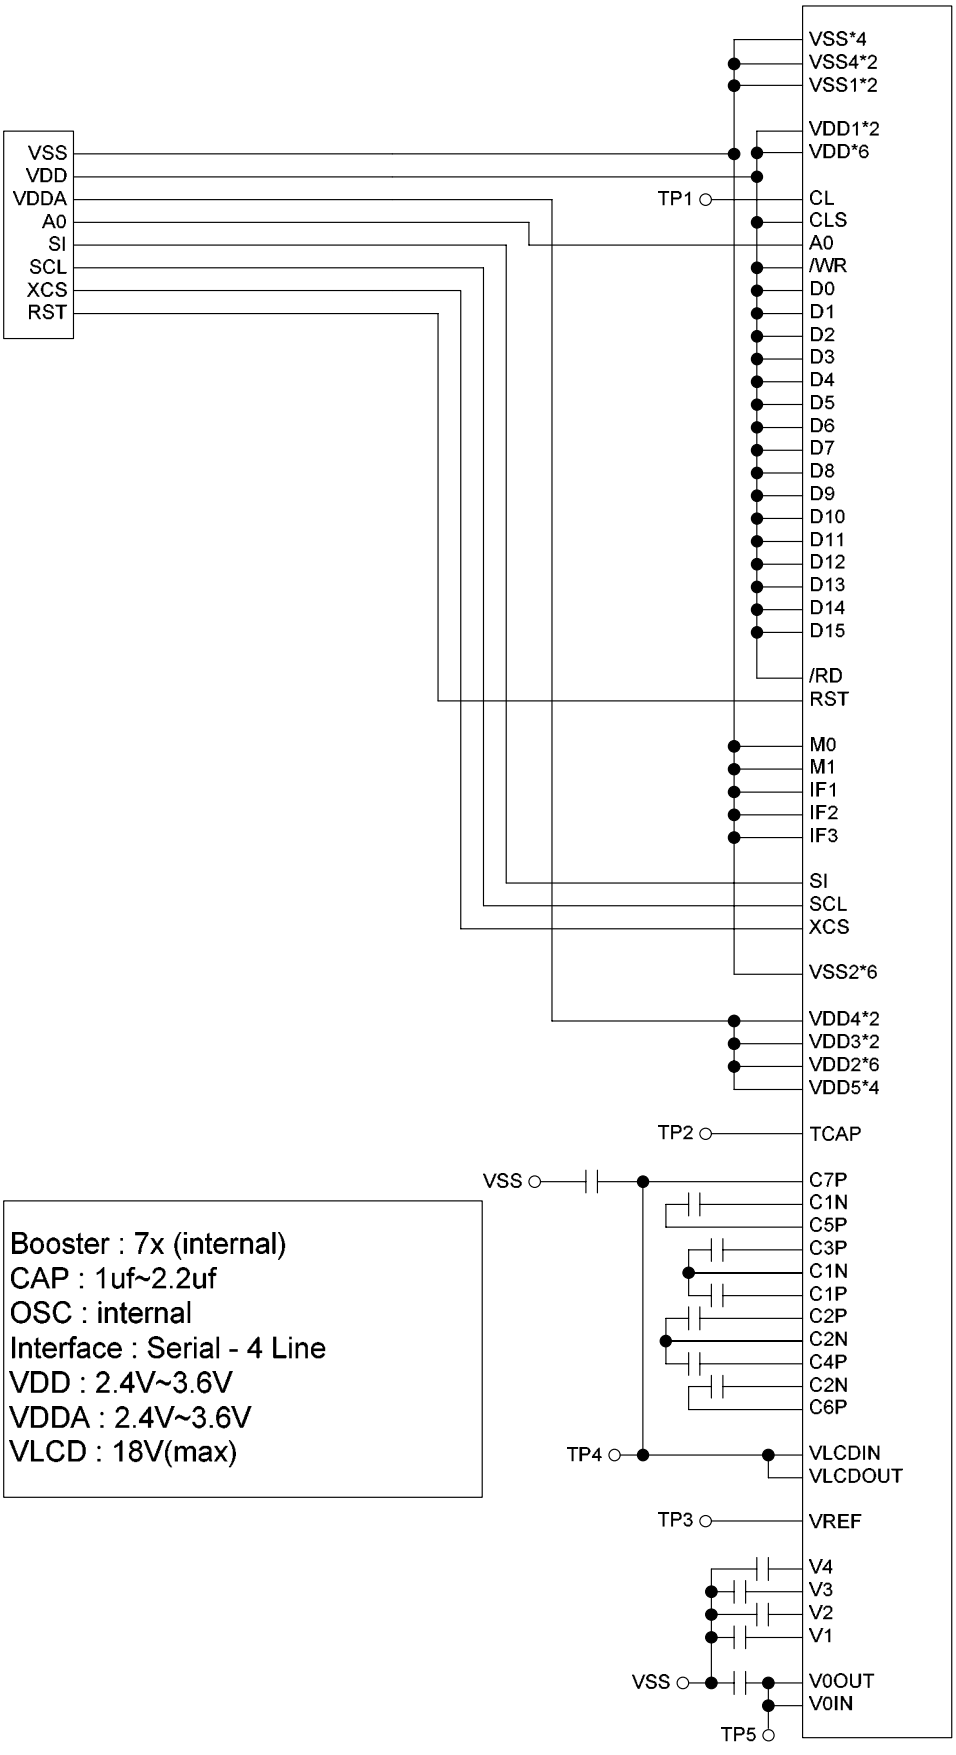
ST7529 / 80serial - 16bit



ST7529 / Serial - 3 Line



ST7529 / Serial - 4 Line



ST7529 / I2C
